## Public Domain Collections: Free to Share & Reuse

[RECOMMEND](#)[EMAIL](#)[PRINT](#)[SHARE](#)

*Did you know that more than 180,000 of the items in our Digital Collections are in the public domain?*

That means everyone has the freedom to enjoy and reuse these materials in almost limitless ways. The Library now makes it possible to download such items in the highest resolution available directly from the Digital Collections website.

### Search Digital Collections

No permission required. No restrictions on use.

Below you'll find tools, projects, and explorations designed to inspire your own creations—go forth and reuse!

Explore what's in the public domain with our [visualization tool](#).

# Historical map polygon and feature extractor

Mauricio Giraldo Arteaga  
New York Public Library Labs  
mauriciogiraldo@nypl.org

Figure 1: From left: original map input, vectorizer output shapefile superimposed on the original map and annotated individual polygon showing the additional attribute data being extracted.

## ABSTRACT

Polygon and attribute data extraction from historical maps such as US insurance atlases from the 19th and early 20th centuries has so far been a manual task. The New York Public Library (NYPL) currently relies on staff and volunteer work to manually extract polygons and other attribute data from its collection to create new public data sets for the study of urban history. This is a time-intensive task requiring up to several minutes to trace a shapefile and transcribe attributes for a single building. In this paper we propose an approach to automatically extract such attribute data from historical maps. The approach makes use of multiple image processing and statistics utilities to produce desirable results in a fraction of the time required to do by hand.

On average, a shapefile for an atlas sheet is generated in ~11.4 minutes for a total of 23.5 hours of processing time for a whole atlas that contains ~55,000 polygons; contrast this time frame to NYPL's current manual process that has taken three years to extract about 170,000 polygons across four New York City street atlases.

Even with some error rate in the proposed approach, the most cumbersome, time-intensive work (manual polygon drawing) has been reduced to a fraction of its original scope. This new workflow has promising implications for historical GIS.

## 1. INTRODUCTION

Vector polygon and attribute data extraction from raster images of historical maps (e.g. in GeoTIFF file format) such as US insurance atlases from the 19th and early 20th centuries has so far been a manual task. Although there exist tools that produce vectors from raster images (e.g. GDAL Polygonize [GDAL 2013]), these require either very clean and simple polygons or human intervention to assist the polygonization algorithm (e.g. clicking specific areas of an image, inputting numerous parameters, manual tracing of the image and other non-automatable processes). Historical maps such as those in the Lionel Pincus and Princess Firyal Map Division of the New York Public Library (NYPL) do not conform to the ideal raster image expected by those tools. The collection includes tens of thousands of sheets from 1853 to 1930 organized in 200 atlases and manual tracing is a time-intensive task requiring up to several minutes to extract data for a single building footprint.

NYPL has relied on volunteer and staff work to extract about 170,000 polygons (Figure 2) and their respective attribute data (e.g. street number, color, dot presence and type) during the past three years using a custom-made open source browser tool [NYPL 2011]. This effort covers only three of the hundreds of atlases in the collection. At this pace, NYPL will be unable to extract the bulk of the data in any reasonable amount of time.

One of the main roadblocks to automation is the nature of the images: most are very old maps that might be damaged or discolored in some way and each institution has different criteria for preserving and scanning them.

Visible Lives: Oral Histories of the Disability Experience

Frank Senior

## Visible Lives

### Oral Histories of the Disability Experience

*Visible Lives: Oral Histories of the Disability Experience* is an oral history project that works to both preserve and document a thematic history through personal recollections. This project will collect stories of people who are living with a disability and the Library will train community members to conduct these interviews. Interviews will be shared in a preservation archive at The Milstein Division and on the New York Public Library website. Public programs will also connect neighborhood residents and project participants.

*Visible Lives* is a project of Andrew Heiskell Braille and Talking Book Library in Manhattan. A public archive will be kept at this local branch for future generations to listen to and research.

For more information about this project or to share YOUR story: Please contact Alexandra Kelly at Outreach Services and Adult Programming, [AlexandraKelly@nypl.org](mailto:AlexandraKelly@nypl.org) or (212) 621-0552.

46127	9	parts of Jersey north and south. But. Some
50367	10	. Some folks will argue there's something called Central
55307	11	Jersey but usually those people that don't come from New Jersey. So
60587	12	North Jersey where I grew up when I was first where I was
65227	13	born we lived actually in playfields in a
70138	14	little apartment my mother and father and my first our first dog to a little
74897	15	poodle who I swear I remember my mother Oh he said I only remember it from
79608	16	pictures because I was so little I couldn't possibly remember the dog.
85347	17	But after you know after a while we move to a bigger house in a town called
89998	18	Middlesex this is all around the same sort of part of New Jersey sort of Union
94737	19	County Somerset County. And then for a while
99498	20	after that we lived there till I was about two and a half or three because my my
104267	21	brother Steven was born at that time. When was this when I was born in one thousand
108918	22	sixty two March one thousand nine hundred sixty two and my brother was born in November of
113877	23	one thousand sixty four. We moved in with my mother's
118877	24	mother for a little while while we were while my parents were searching for a
123388	25	house where at a town where they really wanted to
127938	26	settle. On and that was in North Plainfield New Jersey where I
132787	27	lived for I'd say. Really a year he lived with my grandmother

[Feedback](#)

Alexis Madrigal, a senior editor at *The Atlantic*, mentioned my ongoing [teaching for the Out of Reach](#) project & linked to [cursivebuildings.com](#) yesterday in a real interesting article on all the good things NYPL is doing w/its archives. Rad! So happy to play a part in these important discussions. Back when this project first gained notice on a large scale, the library contacted me out of the blue &, to my surprise, were very supportive of the endeavor (... as I hadn't exactly asked permission to re-imagine their archived stereographs). It's great to see them get positive press in response to their initiative on this matter.
