

# Composition of Metric-Fair Algorithms

# Recall: Individual (aka Metric) Fairness

"Similar people" have similar *probabilities* of "Yes" and "No" outcomes

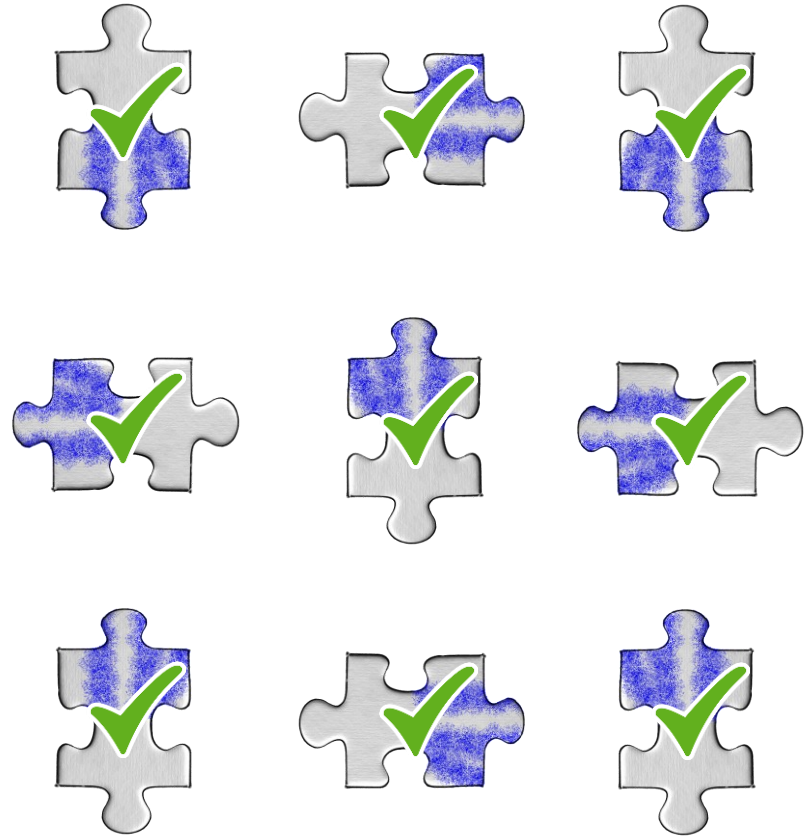

$$C: U \rightarrow \Delta(O)$$
$$||C(x) - C(y)|| \leq d(x, y)$$

## Pop Quiz

- Does Individual Fairness address the equal FPR, FNR, PPV problem?

# Intuition

*If all of the parts are fair, then the whole should be fair.*

# Reality

*It's complicated.*

# Task-Competitive Composition

Tasks 'compete' for individuals.

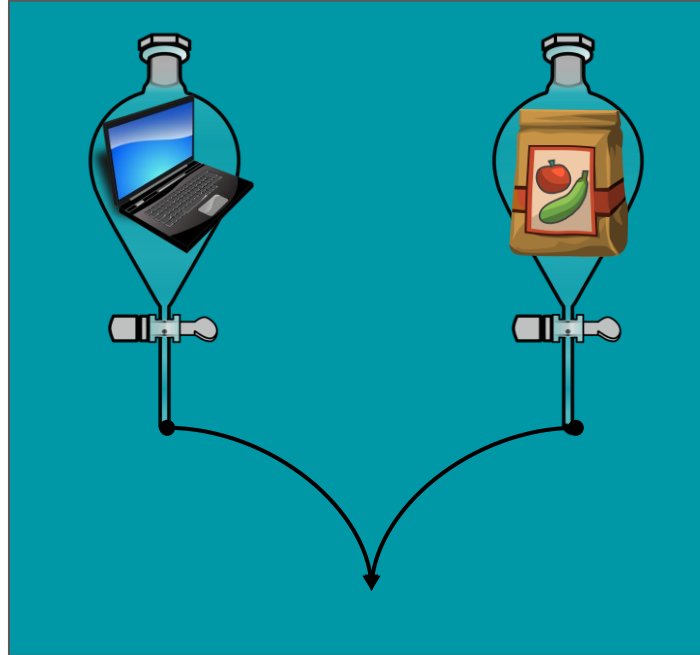

- Example: Advertisers compete for a single ad slot
- Goal: Individual Fairness for tech jobs advertising and groceries advertising *simultaneously*

tech firm vs grocery delivery service

# Naïve Task-Competitive Composition

2 Tech company  
bids among those  
not claimed by  
groceries (\$0.50)

1 Grocery service  
decides whether  
to bid (\$1)

# Not Guaranteed to be Fair

**Theorem.** For any two tasks  $T$  and  $T'$  with nontrivial metrics  $D$ ,  $D'$ , and for any tie-breaking function, not necessarily the same for each individual, there exist classifiers  $C$  and  $C'$  that are individually fair in isolation, but when naïvely combined violate multiple task fairness.

A metric is trivial if all distances are in  $\{0,1\}$

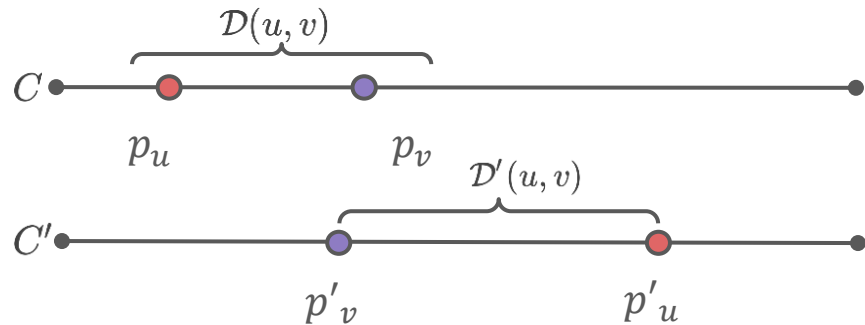

# Not Guaranteed to be Fair

**Theorem.** For any two tasks  $T$  and  $T'$  with nontrivial metrics  $D$ ,  $D'$ , and for any tie-breaking function, not necessarily the same for each individual, there exist classifiers  $C$  and  $C'$  that are individually fair in isolation, but when naïvely combined violate multiple task fairness.

A metric is trivial if all distances are in  $\{0,1\}$

**Proof Sketch (for case ties go to  $T$ )**

- $0 < p_u < p_v$
- $p'_u \geq p'_v > 0$  and the distance is maximized subject to  $D'$ .

# Proof sketch (continued)

The difference in probability of positive classification for  $T'$ :

$$(1-p_u)p'_u - (1-p_v)p'_v = D'(u,v) + p_v p'_v - p_u p'_u$$

If  $D'(u,v) = 0$  then done: ( $p_u < p_v$ ;  $p'_u = p'_v > 0$ )

Write  $\alpha = p_v/p_u$  so  $p_v p'_v - p_u p'_u = \alpha p_u p'_v - p_u p'_u$

$$\alpha p_u p'_v - p_u p'_u > 0 \Leftrightarrow$$

$$\alpha p'_v - p'_u > 0 \Leftrightarrow$$

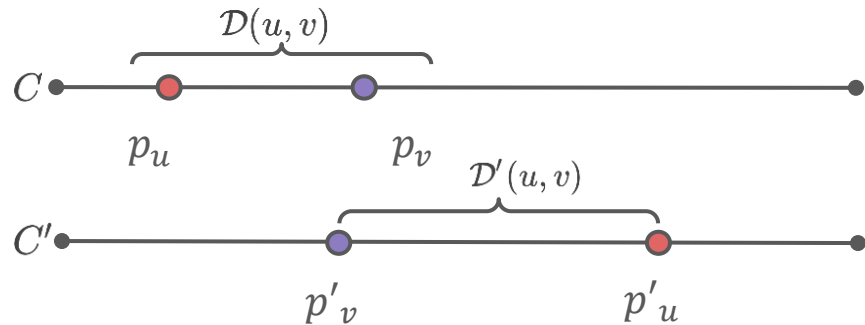

$$\alpha = p_v/p_u > p'_u/p'_v$$

Easy to ensure w/o violating fairness for  $T$ .

Omitted: a bit of cleanup for other elements.

## Proof Sketch (for case ties go to $T$ )

- $0 < p_u < p_v$
- $p'_u \geq p'_v > 0$  and the distance is maximized subject to  $D'$ .

# An Algorithm: Randomize Then Classify

Procedure:

- Fix a probability distribution  $X$  over the tasks.
- Choose a task  $T \sim X$
- Classify using a fair classifier for  $T$ .

Homework: Prove RTC is individually fair.

The background of the image is a faded, handwritten musical score on aged paper. It features multiple staves with various musical notations, including notes, rests, and clefs, written in a cursive style. The text "Functional Composition" is superimposed over the center of the page.

# Functional Composition

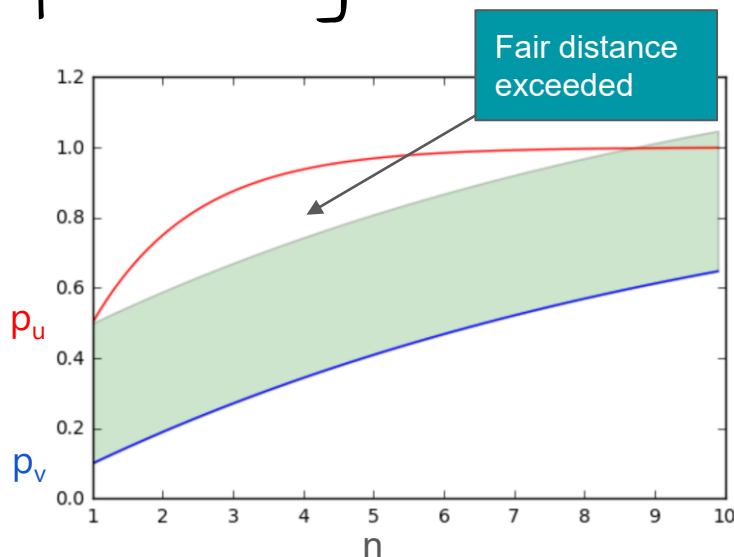

# OR Fairness: Applying to multiple colleges

**Relevant outcome:** get in to at least one college.

**Definition.** A set of classifiers  $C$  for task  $T$  with metric  $D$  satisfy *OR-Fairness* if for all  $u, v$  in  $U$   
 $|p_u - p_v| \leq D(u, v)$ , where  $p_w$  is the probability that  $w$  is accepted by at least one classifier in  $C$ .

**Theorem.** For any nontrivial task, there exists a set of classifiers that are fair in isolation, but violate OR-Fairness.

**Proof Sketch:** Characterize when  $1-(1-p_u)^n$  grows faster than  $1-(1-p_v)^n$ .

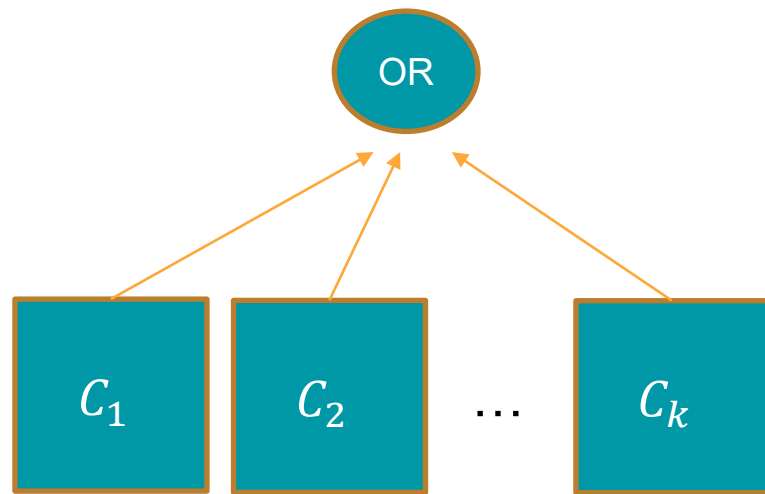

# OR Fairness: Applying to multiple colleges

**Relevant outcome:** get in to at least one college.

**Definition.** A set of classifiers  $C$  for task  $T$  with metric  $D$  satisfy *OR-Fairness* if for all  $u, v$  in  $U$   
 $|p_u - p_v| \leq D(u, v)$ , where  $p_w$  is the probability that  $w$  is accepted by at least one classifier in  $C$ .

**Theorem.** For any nontrivial task, there exists a set of classifiers that are fair in isolation, but violate OR-Fairness.

**Observation.** If for all  $C_i$  and all  $u$  in  $U$  the probability of positive classification for  $u$  under  $C_i$  is above  $1/2$ , then fairness is preserved under OR-composition.

OR of “heavy” ORs

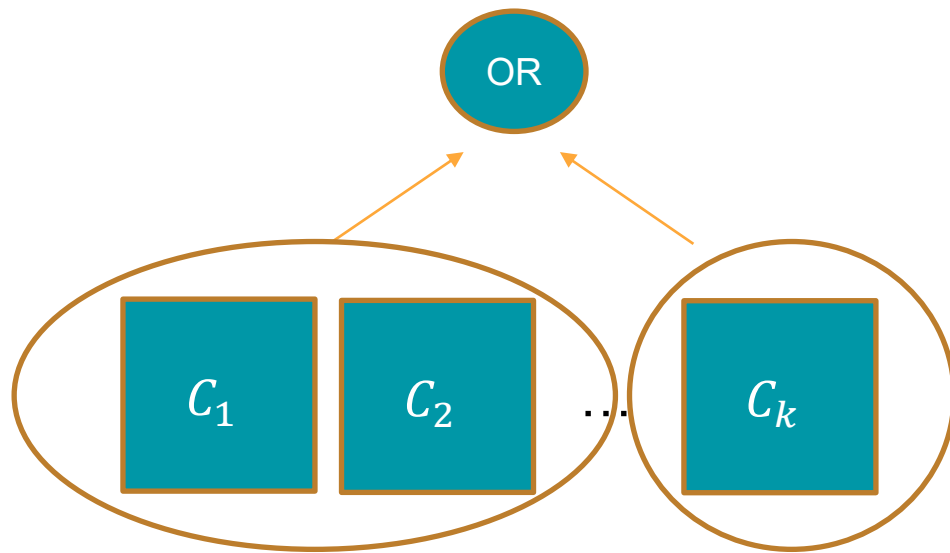

# OR Fairness: Applying to multiple colleges

**Relevant outcome:** get in to at least one college.

**Definition.** A set of classifiers  $C$  for task  $T$  with metric  $D$  satisfy *OR-Fairness* if for all  $u, v$  in  $U$   
 $|p_u - p_v| \leq D(u, v)$ , where  $p_w$  is the probability that  $w$  is accepted by at least one classifier in  $C$ .

**Theorem.** For any nontrivial task, there exists a set of classifiers that are fair in isolation, but violate OR-Fairness.

**Theorem.** Any set of individually fair classifiers for a task which have an aggregate probability of positive classification  $> 1/2$  for all  $u \in U$  also satisfy OR-Fairness.

OR of “heavy” ORs

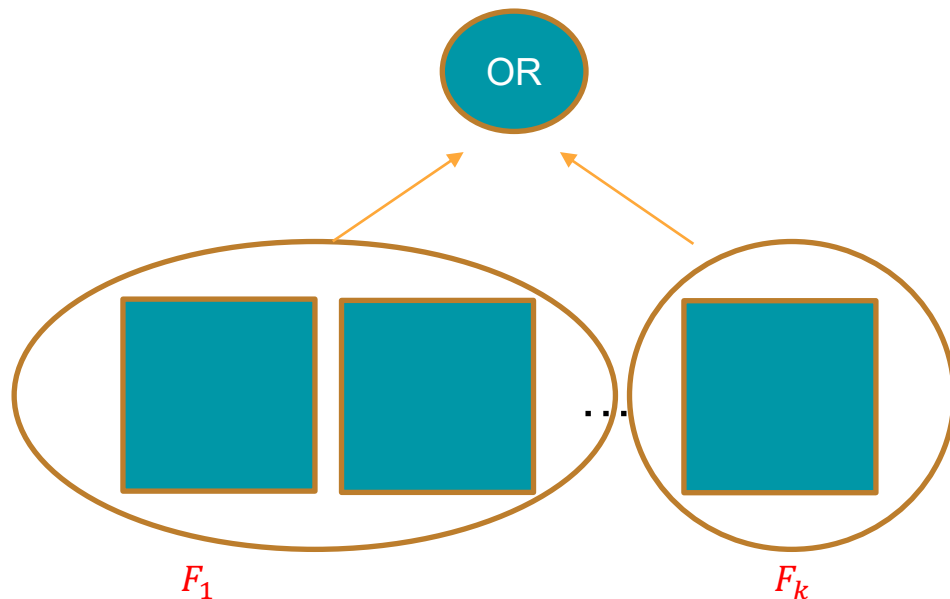

# OR Fairness: Applying to multiple colleges

**Relevant outcome:** get in to at least one college.

**Definition.** A set of classifiers  $C$  for task  $T$  with metric  $D$  satisfy *OR-Fairness* if for all  $u, v$  in  $U$   
 $|p_u - p_v| \leq D(u, v)$ , where  $p_w$  is the probability that  $w$  is accepted by at least one classifier in  $C$ .

**Theorem.** Any set of individually fair classifiers for a task which have an aggregate probability of positive classification  $> 1/2$  for all  $u \in U$  also satisfy OR-Fairness

OR of "heavy" circuits

# Dependent Classifications

# Dependent Compositions

In many cases outcomes are not independent:

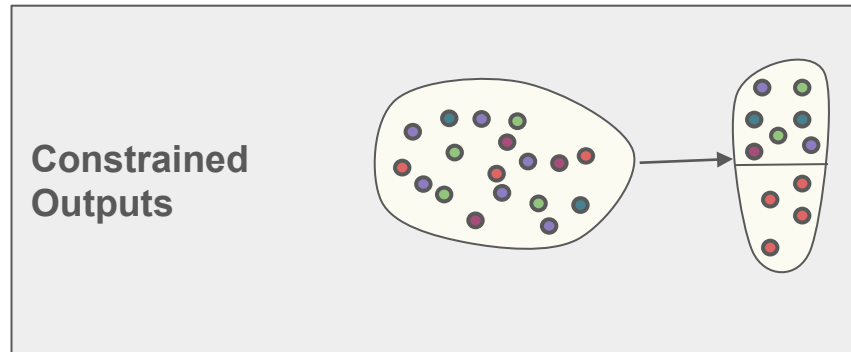

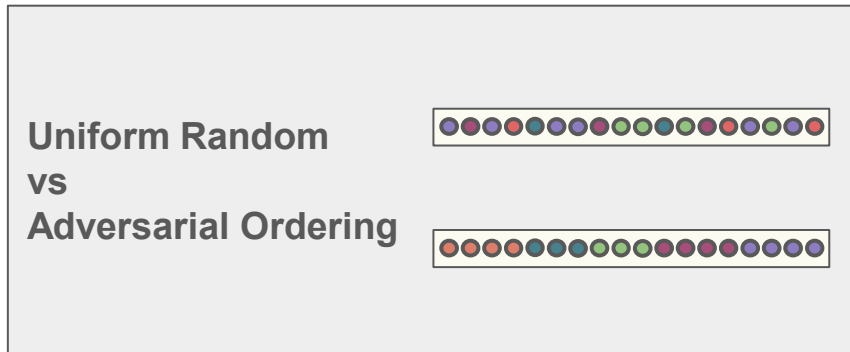

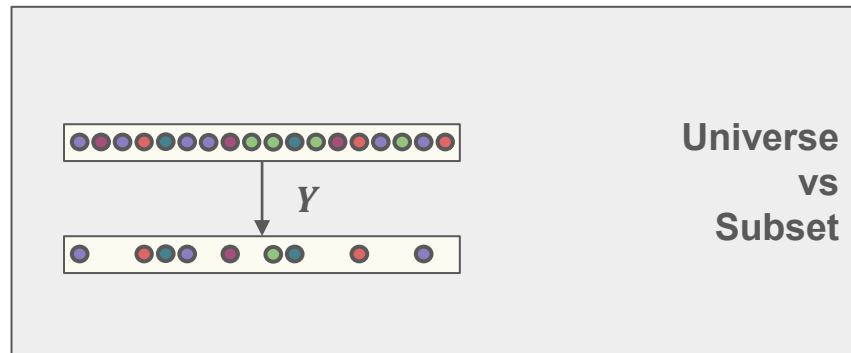

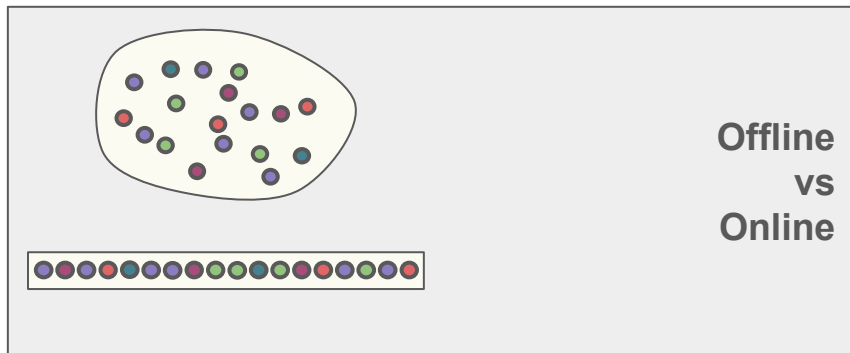

- Can only accept  $n$  students
- Must accept at least  $n/2$  students who can pay tuition
- Can't grant too many loans or hire too many people on a particular day

Two main settings:

- Cohort Selection (fixed size  $n$ )
- Universe Subset Problems: operate on subset, but still want fairness wrt all pairs

# Dependent Composition: Many Possible Axes...

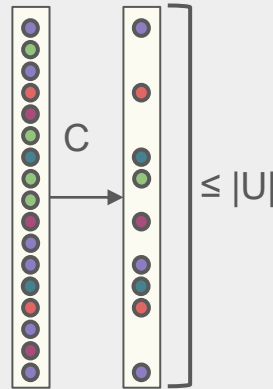

# The Cohort Selection Problem

**Cohort Selection:** Given a universe of individuals  $U$  and an integer  $n < |U|$ , select  $n$  individuals from  $U$  such that for every  $u$  and  $v$  in  $U$  the difference in probability of selection  $p_u$  and  $p_v$  respectively satisfies  $D(u,v) \geq |p_u - p_v|$ .

*Cannot independently classify each element, as the number of previously selected elements must be taken into account.*

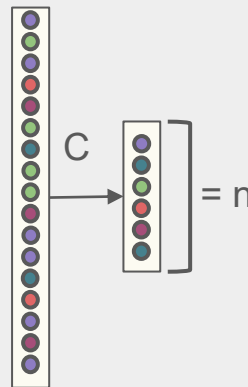

## Independent Classification:

By applying a fair classifier  $C$  independently to each element, can select up to  $|U|$  elements.

## Cohort Selection:

Must select  $n$  elements without increasing distances. Probability of selection dependent on other elements.

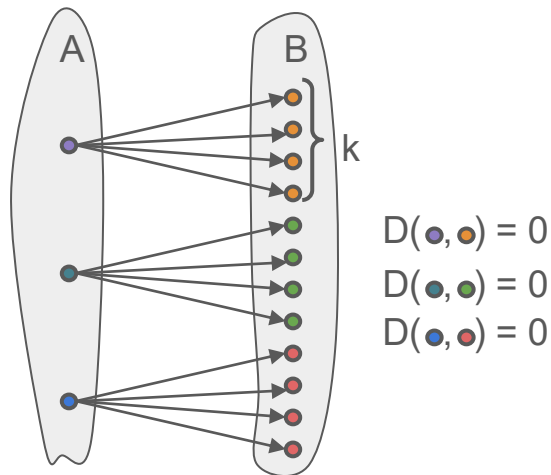

# Constrained Cohort Selection

**Definition.** For  $A \subseteq U$ ,  $p \in [0,1]$ , fairly select a set of  $n$  elements of  $U$  such that at least a  $p$  fraction of those selected are in  $A$ .

- Must have at least  $n/2$  students who pay full tuition to cover operating costs
- Must satisfy statistical parity for legal reasons
- Must accept at least  $p \cdot n$  students of each gender who can play a particular sport to field a team

# An Impossibility Result (simple special case)

$$D(\text{blue}, \text{blue}) = 0$$

$$D(\text{green}, \text{green}) = 0$$

$$D(\text{red}, \text{red}) = 0$$

B is a blown-up version of A, and  $|A| = n/2 = pn$

$$\forall u \in A: p_u = 1$$

$\exists v \in B: p_v \leq 1/k$ . Let  $u \in A$  satisfy  $D(u, v) = 0$ .

QED.

# The Universe Subset (Cohort Selection) Problem

Let  $\mathbf{Y}$  be a distribution over subsets of  $U$ . Let  $\mathbf{X}=\{\mathbf{X}(V)\}_{V \subseteq U}$  be family a distributions, where  $\mathbf{X}(V)$  is a distribution on permutations of the elements of  $V$ . For a system  $S_n: \Pi(2^U) \times r \rightarrow U^*$ , Experiment( $S_n, \mathbf{X}, \mathbf{Y}, u$ ):

1. Choose  $r \sim \{0,1\}^*$
2. Choose  $V \sim \mathbf{Y}$
3. Choose  $\pi \sim \mathbf{X}(V)$
4. Run  $S_n$ , and output 1 if  $u$  is selected

The system is individually fair (and a solution to the Cohort Selection Problem) if  $\forall u, v \in U$ ,

$$|\mathbb{E}[\text{Experiment}(S_n, \mathbf{X}, \mathbf{Y}, u)] - \mathbb{E}[\text{Experiment}(S_n, \mathbf{X}, \mathbf{Y}, v)]| \leq D(u, v)$$

(and  $S_n$  outputs a set of  $n$  distinct elements of  $U$ ).

# Solutions for Basic, Offline Cohort Selection

**Easiest Setting:** decisions made offline, with access to the entire universe  $U$  and the metric  $D$  with no constraints on the output set other than size.

## Permute then Classify

1. Choose  $\pi \sim S_{|U|}$ , where  $S_{|U|}$  is the set of all permutations of  $|U|$  elements
2. Apply  $\pi$  to  $U$ , and classify each element as usual until either:
  - $n$  elements are selected: stop
  - there are exactly enough elements left in the permutation to select  $n$  total: take all remaining elements

## Weighted Sampling

1. Enumerate all sets of size  $n$ , and for each set  $T$  assign weight  $w(T) \propto \sum_{u \in T} E[C(u)]$
2. Sample from all of the sets with probability proportional to the weights

# Individual Fairness in Pipelines

- Hire a cohort; one year later, promote a cohort member to team leader
  - Whether or not you are promoted depends on the cohort
  - Not so crazy: hiring decisions not necessarily made by team's organizational head; hiring manager often different than manager one year later
- Gives rise to yet another catalog of evils

# Two-Stage Cohort Pipeline

- Universe  $U$ , Permissible set of cohorts  $C \subseteq \text{Pow}(U) \setminus \emptyset$
- Cohort selection mechanism  $A: U \rightarrow C$ , aka the “hiring manager”
- A set of scoring functions  $F: C \times U \rightarrow [0,1]$  and  $f \in F$ 
  - Scoring is contextual, i.e., may have  $f(c, u) \neq f(c', u)$
  - Undefined if  $u \notin C$
- The pipeline is  $A \circ f$
- $C_u$ : set of cohorts in  $C$  containing individual  $u \in U$
- Probability that  $A$  selects  $u$  is  $p(u) = \sum_{c \in C_u} \Pr[A(U) = c]$ 
  - Assume intra-cohort fairness  $\forall c \in C \forall u, v \in c |f(c, u) - f(c, v)| \leq d(u, v)$

# Informal, Deceptively Simple, Fairness Definition

For  $f \in F$ , the pipeline instantiated with  $f$  is individually fair with respect to similarity metric  $d$  and distribution metric  $D: \Delta(O_{\text{pipeline}}) \times \Delta(O_{\text{pipeline}}) \rightarrow [0,1]$  if  $\forall u, v \in U: D([f \circ A](u), [f \circ A](v)) \leq d(u, v)$ .

If the pipeline is individually fair wrt  $d, D$  for all  $f \in F$ , then it is robust to  $F$ .

The hitch: outcome space  $O_{\text{pipeline}} = [0,1] \cup \{\perp\}$ : individuals drop out, voluntarily or otherwise, from the pipeline.

# Unconditional and Conditional Distributions

Probability that  
A outputs  $c \in \mathcal{C}$

Starting point:

$\xi_u \in \Delta(\mathcal{O}_{\text{pipeline}})$  places probability  $1 - p(u)$  on  $\perp$

$\xi_u \in \Delta(\mathcal{O}_{\text{pipeline}})$  places probability  $\sum_{c \in \mathcal{C}_u} \Pr[f(c, u) = s] P_A(c)$  on  $s \in [0, 1]$

Unconditional distribution: as above, but treat  $\perp$  as having score of 0

For  $s \in (0, 1]$ : place probability  $\sum_{c \in \mathcal{C}_u} \Pr[f(c, u) = s] P_A(c)$  on  $s$

For  $s = 0$ : place probability  $1 - p(u) + \sum_{c \in \mathcal{C}_u} \Pr[f(c, u) = 0] P_A(c)$

Conditional distribution: condition on positive  $p(u)$ :

For  $s \in [0, 1]$  place probability  $\frac{\sum_{c \in \mathcal{C}_u} \Pr[f(c, u) = s] P_A(c)}{p(u)}$  on  $s$

## Is This Fair?

- $d(u, v) = 0.1$
- Under  $A$ ,  $p(u) = p(v) \stackrel{\text{def}}{=} p^*$  but  $A$  never outputs a cohort containing both
- Constrain  $f$  for the unconditional distribution  $|p(u)f(u) - p(v)f(v)| \leq d(u, v)$ ,  
Simplifies to  $p^*|f(u) - f(v)| \leq d(u, v)$
- Weak fairness constraint when  $p^*$  is small!

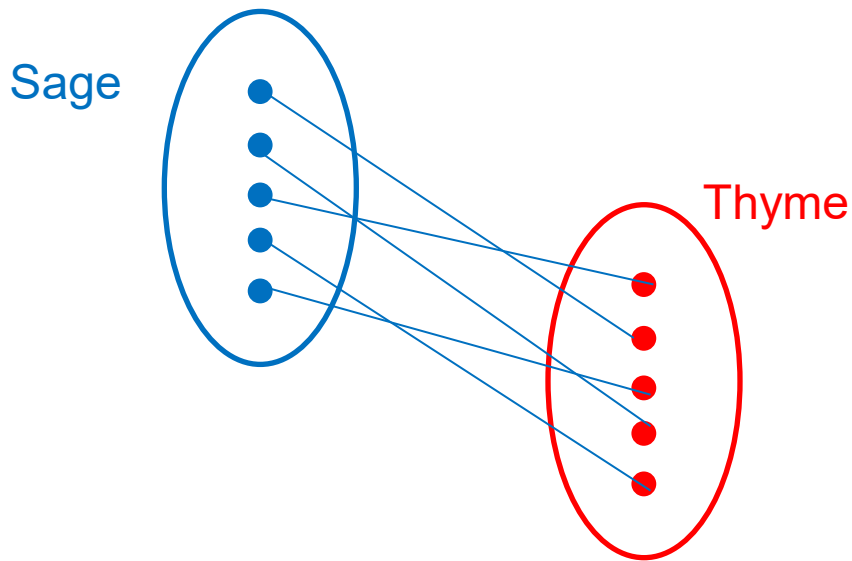

*Congratulations, you are offered a job! After a year you, may expect a promotion with probability  $f(u)$  (or, for  $v$ ,  $f(v)$ ).*

Ulfar and Virginia receive offers with the same probability, but correctly perceive the offers very differently.

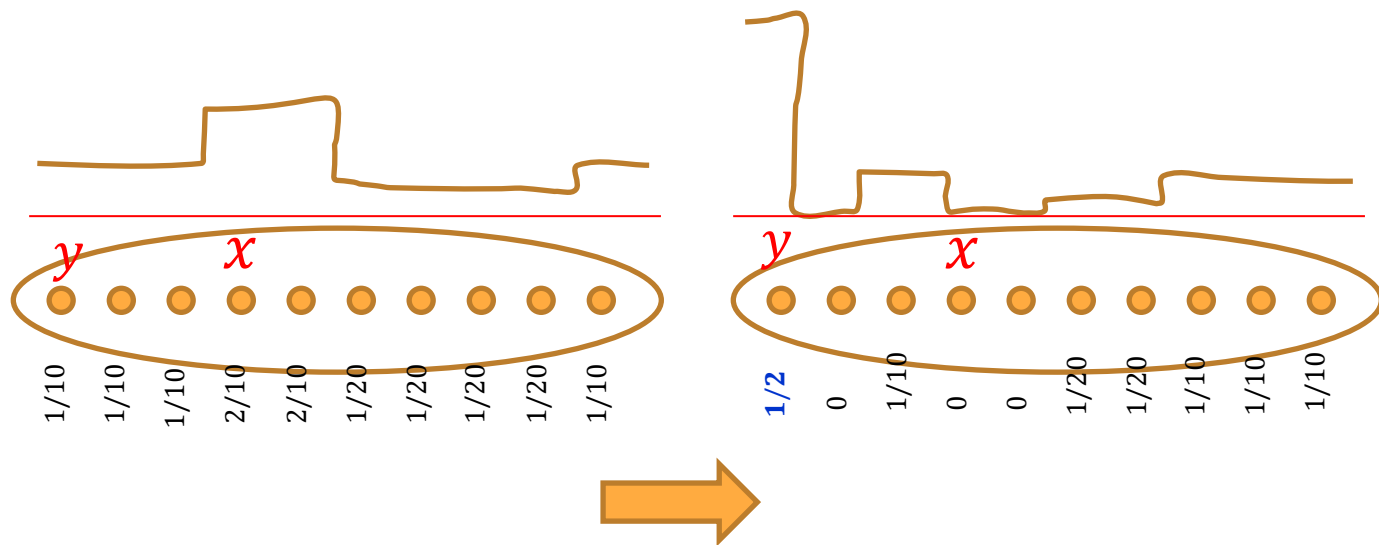

Metric-Fair Affirmative Action

# Fair AA via Metrics (highly simplified)

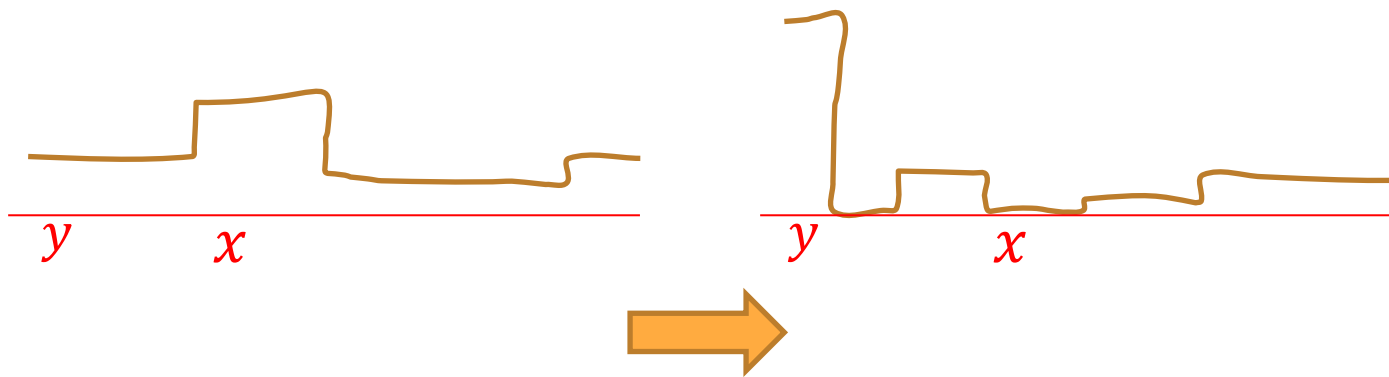

- Pair up  $S$ 's and  $T$ 's to minimize  $\sum_i d(s_i, t_{\text{pair}(s_i)})$
- Classify  $s_i$  by classifying  $t_{\text{pair}(s_i)}$

# Transforming One Distribution to Another

# Transforming One Distribution to Another

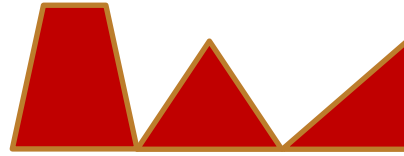

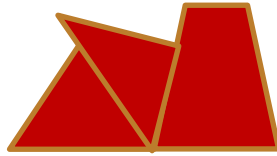

“Cost” (in clay-moving) captures difference between distributions

$$d(y, y) = 0$$

$d(x, y)$  depends on the metric

# The Earthmover Linear Program

$$EM(S, T) = \min \sum_{x, y \in V} h(x, y) d(x, y)$$

s.t.

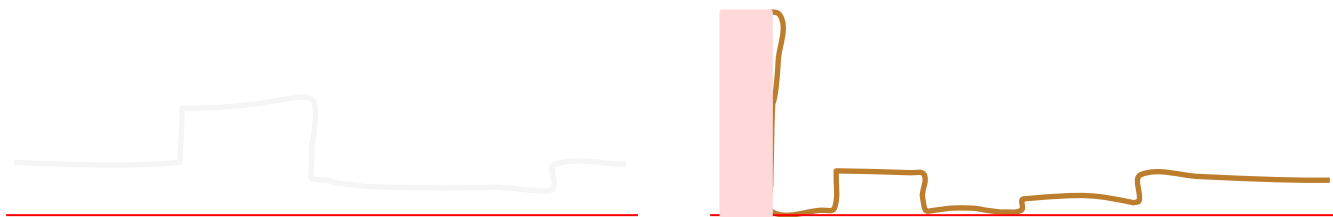

$$\sum_{x \in V} h(x, y) = T(y)$$

$$\sum_{y \in V} h(x, y) = S(x)$$

$$h(x, y) \geq 0$$

Amount to  
“haul” from  
 $x$  to  $y$

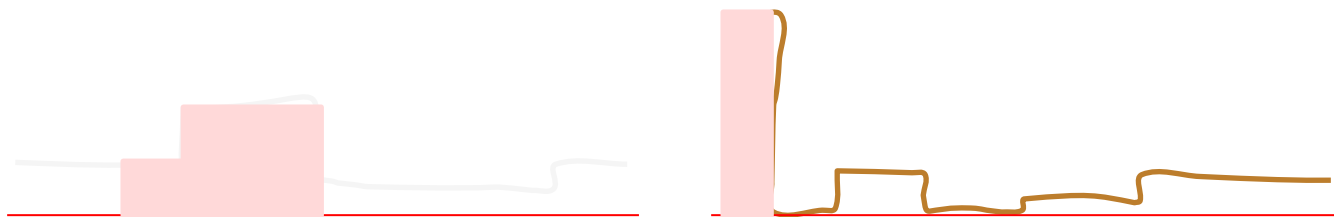

# Transforming One Distribution to Another

Suppose  $1/2$  the clay on the right is pink...

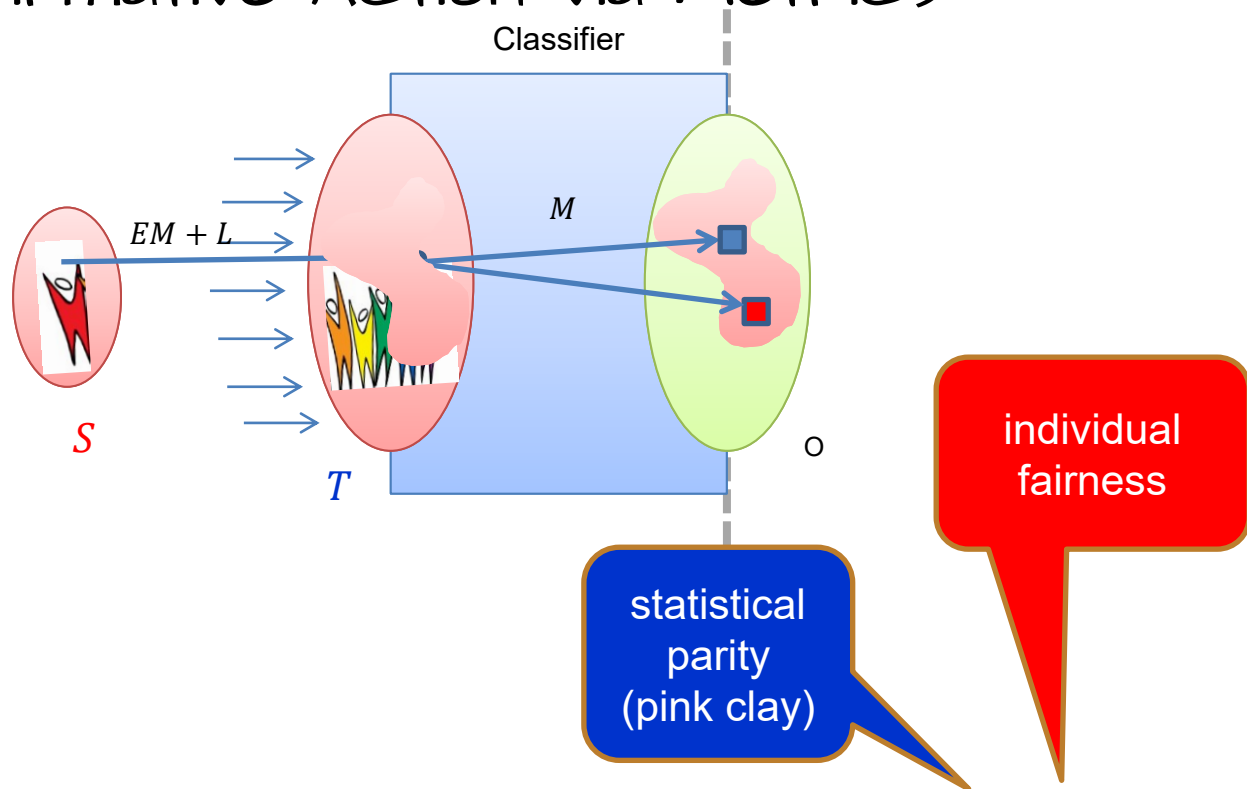

# Transforming One Distribution to Another

Then  $1/2$  the clay on the left is pink!

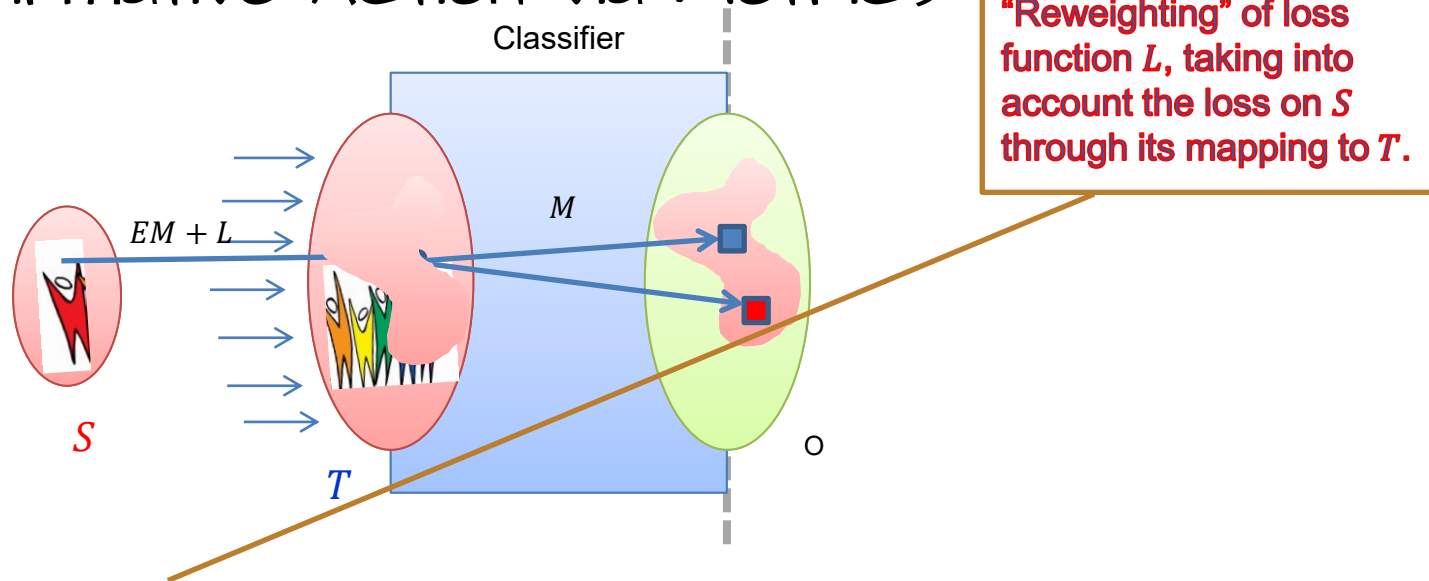

# Fair Affirmative Action via Metrics

Map uniform distribution on  $S$  to uniform distribution on  $T$  (via EM,  $L$ )

# Fair Affirmative Action via Metrics

1.  $\forall y \in T, o \in O : L'(y, o) = \sum_{x \in S} \mu_x(y) L(x, o) + L(y, o)$  where  $\mu_x$  is from the EM+L mapping
2. Run the Fairness LP only on  $T$ , using  $L'$

# Fair Affirmative Action via Metrics

$$d_{\{EM+L\}}(S, T) \stackrel{\text{def}}{=} \min E_{x \in S} E_{y \sim \mu_x} d(x, y)$$

s.t.

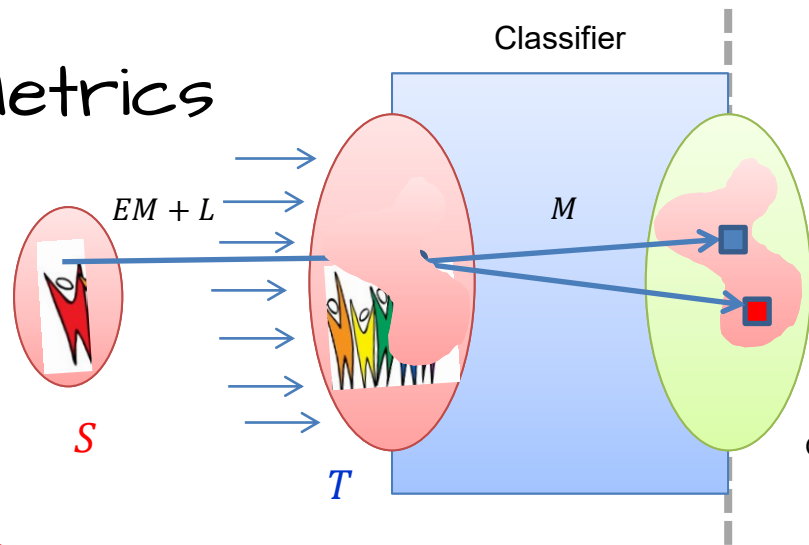

$$D(\mu_x, \mu_{x'}) \leq d(x, x') \quad \forall x, x' \in S$$

$$D_{TV}(\mu_S, U_T) \leq \varepsilon$$

$$\mu_x \in \Delta(T) \quad \forall x \in S$$

Given  $\{\mu_x\}_{x \in S}$  here and  $\{v_x\}_{x \in T}$  from Fairnes LP,  
define:  $M: V \rightarrow \Delta(O)$ :

$$M(x) = \begin{cases} v_x & x \in T \\ E_{y \sim \mu_x} v_y & x \in S \end{cases}$$

$$\forall y \in T: \mu_S(y) = E_{x \sim S} \mu_x(y)$$

# Fair Affirmative Action via Metrics

$$d_{\{EM+L\}}(S, T) \stackrel{\text{def}}{=} \min E_{x \in S} E_{y \sim \mu_x} d(x, y)$$

s.t.

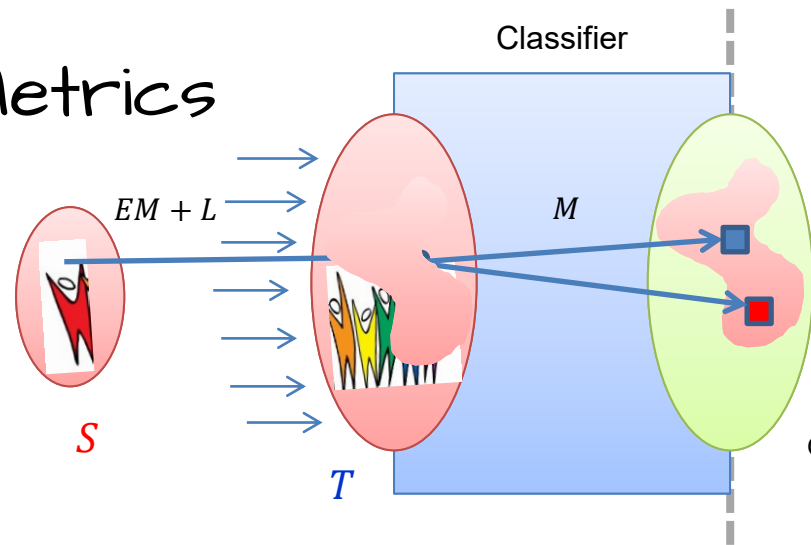

$$D(\mu_x, \mu_{x'}) \leq d(x, x') \quad \forall x, x' \in S$$

$$D_{TV}(\mu_S, U_T) \leq \varepsilon$$

$$\mu_x \in \Delta(T) \quad \forall x \in S$$

Given  $\{\mu_x\}_{x \in S}$  here and  $\{v_x\}_{x \in T}$  from Fairnes LP,  
define:  $M: V \rightarrow \Delta(O)$ :

$$M(x) = \begin{cases} v_x & x \in T \\ E_{y \sim \mu_x} v_y & x \in S \end{cases}$$

Minimizes loss AND disruption of  $S \times T$   
Lipschitz requirement, subject to parity and  
the within-group Lipschitz constraints

# Fair Affirmative Action via Metrics

$$d_{\{EM+L\}}(S, T) \stackrel{\text{def}}{=} \min E_{x \in S} E_{y \sim \mu_x} d(x, y)$$

s.t.

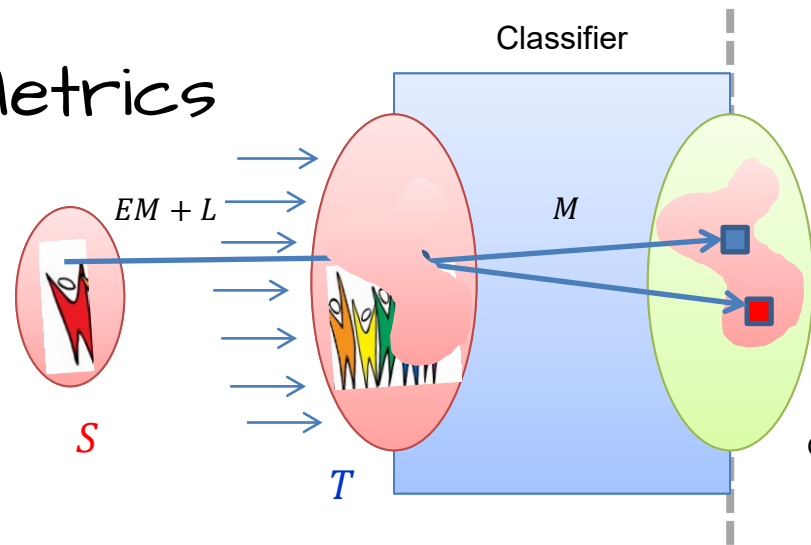

$$D(\mu_x, \mu_{x'}) \leq d(x, x') \quad \forall x, x' \in S$$

$$D_{TV}(\mu_S, U_T) \leq \varepsilon$$

$$\mu_x \in \Delta(T) \quad \forall x \in S$$

Given  $\{\mu_x\}_{x \in S}$  here and  $\{v_x\}_{x \in T}$  from Fairnes LP, define:  $M: V \rightarrow \Delta(O)$ :

$$M(x) = \begin{cases} v_x & x \in T \\ E_{y \sim \mu_x} v_y & x \in S \end{cases}$$

More flexibility still: can eliminate the re-weighting, prohibiting expression of opinions on the fate of elements in  $S$ . May make sense if vendor has done no market research on  $S$

# Fair Affirmative Action via Metrics

$$d_{\{EM+L\}}(S, T) \stackrel{\text{def}}{=} \min E_{x \in S} E_{y \sim \mu_x} d(x, y)$$

s.t.

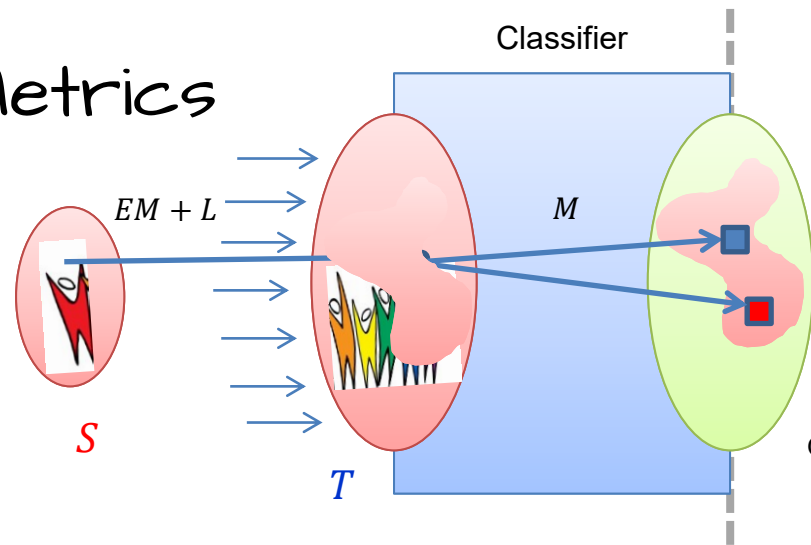

$$D(\mu_x, \mu_{x'}) \leq d(x, x') \quad \forall x, x' \in S$$

$$D_{TV}(\mu_S, U_T) \leq \varepsilon$$

$$\mu_x \in \Delta(T) \quad \forall x \in S$$

Given  $\{\mu_x\}_{x \in S}$  here and  $\{v_x\}_{x \in T}$  from Fairness LP, define:  $M: V \rightarrow \Delta(O)$ :

$$M(x) = \begin{cases} v_x & x \in T \\ E_{y \sim \mu_x} v_y & x \in S \end{cases}$$

Compare to just adding statistical parity the Fairness LP, and eliminating the cross-group Lipschitz constraints: the approach here is more faithful to the  $S \times T$  distances, providing protection against the “self-fulfilling prophecy” evil in which one deliberately selects the “wrong” subset of  $S$

# Fair Affirmative Action via Metrics

$$d_{\{EM+L\}}(S, T) \stackrel{\text{def}}{=} \min E_{x \in S} E_{y \sim \mu_x} d(x, y)$$

s.t.

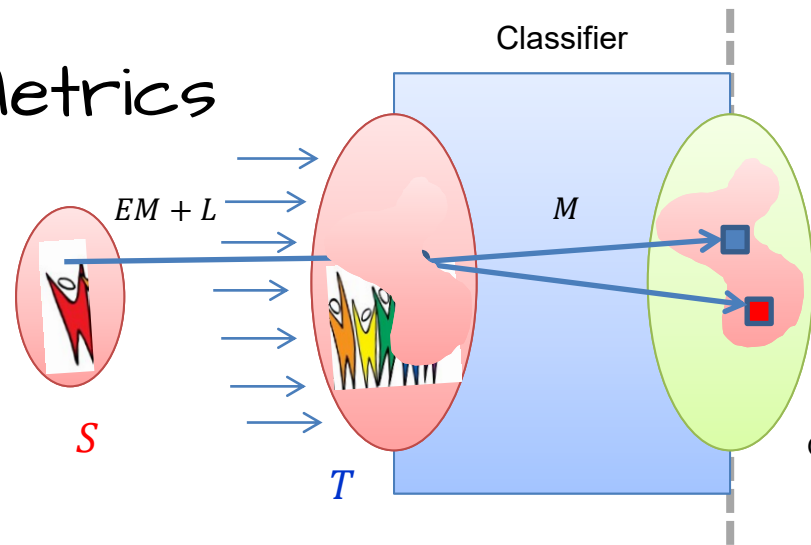

$$D(\mu_x, \mu_{x'}) \leq d(x, x') \quad \forall x, x' \in S$$

$$D_{TV}(\mu_S, U_T) \leq \varepsilon$$

$$\mu_x \in \Delta(T) \quad \forall x \in S$$

Given  $\{\mu_x\}_{x \in S}$  here and  $\{v_x\}_{x \in T}$  from Fairnes LP, define:  $M: V \rightarrow \Delta(O)$ :

$$M(x) = \begin{cases} v_x & x \in T \\ E_{y \sim \mu_x} v_y & x \in S \end{cases}$$

**The metric is everything.**

In this view, one can adjust the metric in such a way that the Lipschitz condition will imply statistical parity; makes sense if one believes that the metric does not fully reflect potential that may be undeveloped because of unequal access to resources. Reflected in the ranking approach discussed below.

# Fair Affirmative Action via Metrics

$$d_{\{EM+L\}}(S, T) \stackrel{\text{def}}{=} \min E_{x \in S} E_{y \sim \mu_x} d(x, y)$$

s.t.

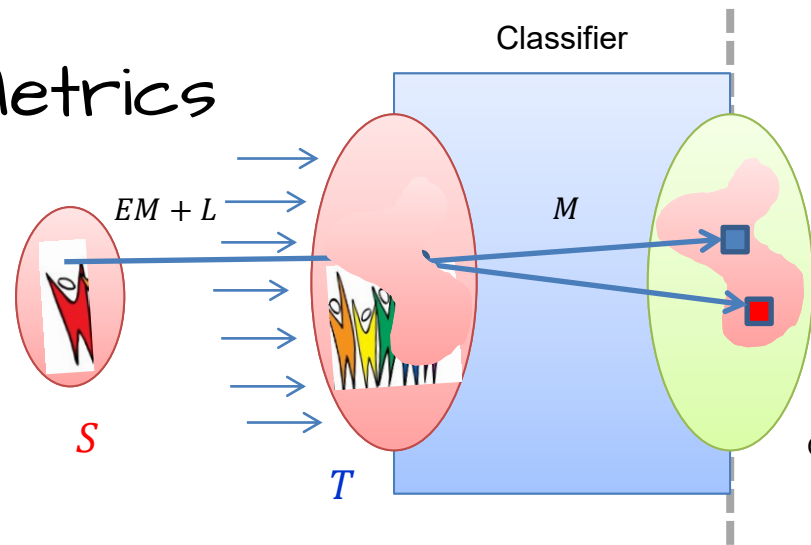

$$D(\mu_x, \mu_{x'}) \leq d(x, x') \quad \forall x, x' \in S$$

$$D_{TV}(\mu_S, U_T) \leq \varepsilon$$

$$\mu_x \in \Delta(T) \quad \forall x \in S$$

Given  $\{\mu_x\}_{x \in S}$  here and  $\{v_x\}_{x \in T}$  from Fairnes LP, define:  $M: V \rightarrow \Delta(O)$ :

$$M(x) = \begin{cases} v_x & x \in T \\ E_{y \sim \mu_x} v_y & x \in S \end{cases}$$

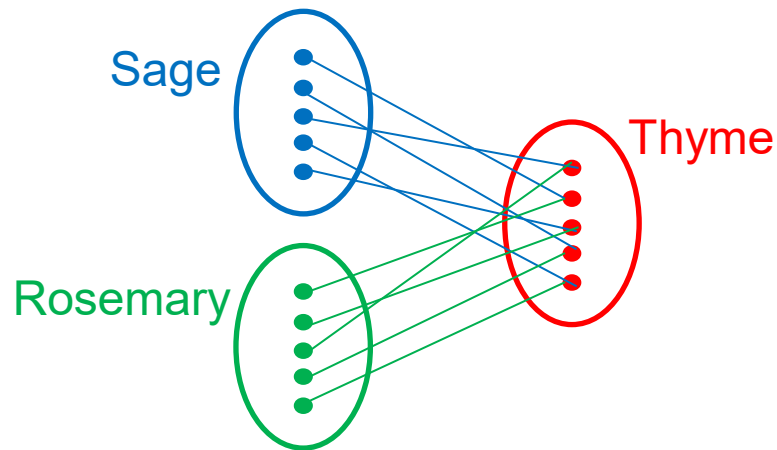

Claim:  $M(x)$  satisfies

- (1) statistical parity between  $S$  and  $T$  up to bias  $\varepsilon$ ; and
- (2) the Lipschitz condition for every within-group pair.

$$\begin{aligned} D_{TV}(M(S), M(T)) &= D_{TV}(E_{x \in S} E_{y \sim \mu_x} v_y, E_{x \in T} v_x) \\ &\leq D_{TV}(\mu_S, U_T) \leq \varepsilon \end{aligned}$$

# Fair Affirmative Action via Metrics

- We know how to handle multiple disjoint groups / strata / ZIP+4s
  - With a metric
- The intersectional case?

# Fair Affirmative Action via Rankings

- Example: Universities of Texas and California
  - Top 10% of students in each high school class
- Example [John Roemer]:
  - Stratify students according to education level of mother
  - Rank students within each stratum by number of hours spent on homework per week
  - Admit to university top k% from each stratum
- Example [Danielle Allen, "Talent is Everywhere"]
  - Stratify students according to SAT/GPA and discard all below a fixed threshold
  - Admit randomly so as to maximize geographic diversity

# Metric-Fair Affirmative Action

- We know how to handle multiple disjoint groups / strata / ZIP+4s
  - With a metric
  - Without a metric, from a "fair ranking"
- The intersectional case?
- *Can address intersectionality via Evidence-Based Ranking*
  - *Hold that thought*
