Single-detector time

Glitch impact on sensitivity is larger during single-detector periods as coincidence with additional detector is impossible. Can machine learning help?

Single-detector time:

✓ 2.7 months in O1+O2; 1.6 month in O3

Training data: 3 classes

Segments of glitches and "clean" noise data samples from the one month of LIGO O1 run (downsampled to 2048) Hz), whitened by the amplitude spectral density of the noise.

Real detector noise from real data when nor glitches nor signals nor injections are present

Real detector noise (selected as noise class) + BBH injections

Data containing glitches (glitches inferred from 2+ detector) periods with gravity spy and cWB)

Details on the dataset

- Segments of fixed duration: 1 second
- Bandpass filter [20,1000] Hz
- No superposition between segments in 1 month dataset
- Glitch position random in the segment (if short duration, fully contained) or tailing over multiple segments if duration > 1 s
 Samples for training:
 - Noise: 2.5e5
 - Signal: 2.5e5
 - Glitch: 0.7e5
 - Samples for testing:
 - Noise: 5.2e5
 - Signal: 2.5e5
 - Glitch: 0.8e5

A. Trovato, GWAWS4, 29 Nov - 3 Dec 2021

Signal injection:

- Position random in the segment but almost fully contained
- Type pf signal: (BBH)
 - m1+m2 ∈ (33,60) M⊙
 - SNR ∈ (8,20)

CNN used as starting point

classifier to distinguish the 3 classes: noise, noise+signal, glitches

	Convolutional
La La Senti de la della della come dimitare e Inte de la presenta de	Layers

Layer #	1	2
Туре	Conv	Conv
Filters	64	32
Kernel	16	8
Strides	4	2
Activation	relu	relu
Dropout	0.5	0.5
Max Pool	4	2

A. Trovato, GWAWS4, 29 Nov - 3 Dec 2021

CNN used: small network with 4 convolution layers (with dropouts and pooling) used as

Fully Connected Layer

Output: probability of belonging to each class

3	4	5
Conv	Conv	Dense
16	8	
8	4	
2		
relu	relu	softmax
0.25	0.25	X - X
2	2	$\overline{\mathbf{X}}$

Optimiser: Adam (except otherwise indicated)

Probability to be classified as signal

Use the probability of the signal classification as statistic to distinguish signal vs noise+glitches

Efficiency vs probability

	Prob>0.8	Prob>0.85	Prob>0.9	Prob>0.95
SNR>8	85%	84%	82%	79%
SNR>10	90%	89%	88%	86%
SNR>14	94%	94%	93%	92%

FAP vs Probability

Star

Std +

More

A. Trovato, GWAWS4, 29 Nov - 3 Dec 2021

- "Std" standard architecture used for reference filters= 64,32,16,8
- Use of another optimiser Nadam
- Comparison with a similar architecture with more filters: 256,128, 64,64

Efficiency at SNR=8 when noise FAP<1e-4

	Cut	Efficiency	Glitch FAP
ndard	0.94	78%	2.37e-04
Nadam	0.98	80%	1.62e-04
filters	0.80	80%	2.25e-04

ROC: efficiency vs FAP

- Nadam optimiser allows to get an improvement
- Increasing the number of filters goes also in the right direction and the improvement is more evident at higher SNR

NN architectures for time series

Literature of NN architectures for time series TCN: Temporal Convolutional Network (next slides) IT: Inception Time (https://arxiv.org/abs/1909.04939) g2net kaggle competition: a lot of results used EfficientNet (arXiv:1905.11946v5)

width/resolution using a simple yet highly effective compound coefficient

- Invision with a second seco

Temporal Convolutional Network

Web page: https://github.com/philipperemy/keras-tcn Paper: https://arxiv.org/abs/1803.01271 Arguments of the TCN TCN(

Easy to install: pip install keras-tcn

2017).) The distinguishing characteristics of TCNs are: 1) the convolutions in the architecture are causal, meaning that there is no information "leakage" from future to past; 2) the architecture can take a sequence of any length and map it to an output sequence of the same length, just as with an RNN. Beyond this, we emphasize how to build very long effective history sizes (i.e., the ability for the networks to look very far into the past to make a prediction) using a combination of very deep networks (augmented with residual layers) and dilated convolutions.

Pay attention to the **receptive field** (you how far the model can see in terms of timesteps)

$$R_{field} = 1 + 2 \cdot (K_{size} - 1) \cdot N_{stack} \cdot \sum d_i$$

A. Trovato, GWAWS4, 29 Nov - 3 Dec 2021

	kernel_size=3, kernel size in all the layers
	nb_stacks=1,
