

An aerial photograph showing a vast expanse of white, puffy cumulus clouds. The clouds are densely packed and appear to be rising from a surface, creating a textured, three-dimensional effect. The sky is a clear, deep blue, visible between the cloud tops. The lighting is bright, suggesting a sunny day, and the overall scene is serene and expansive.

**What can we learn from
super-parameterization?**

Why build GCMs?

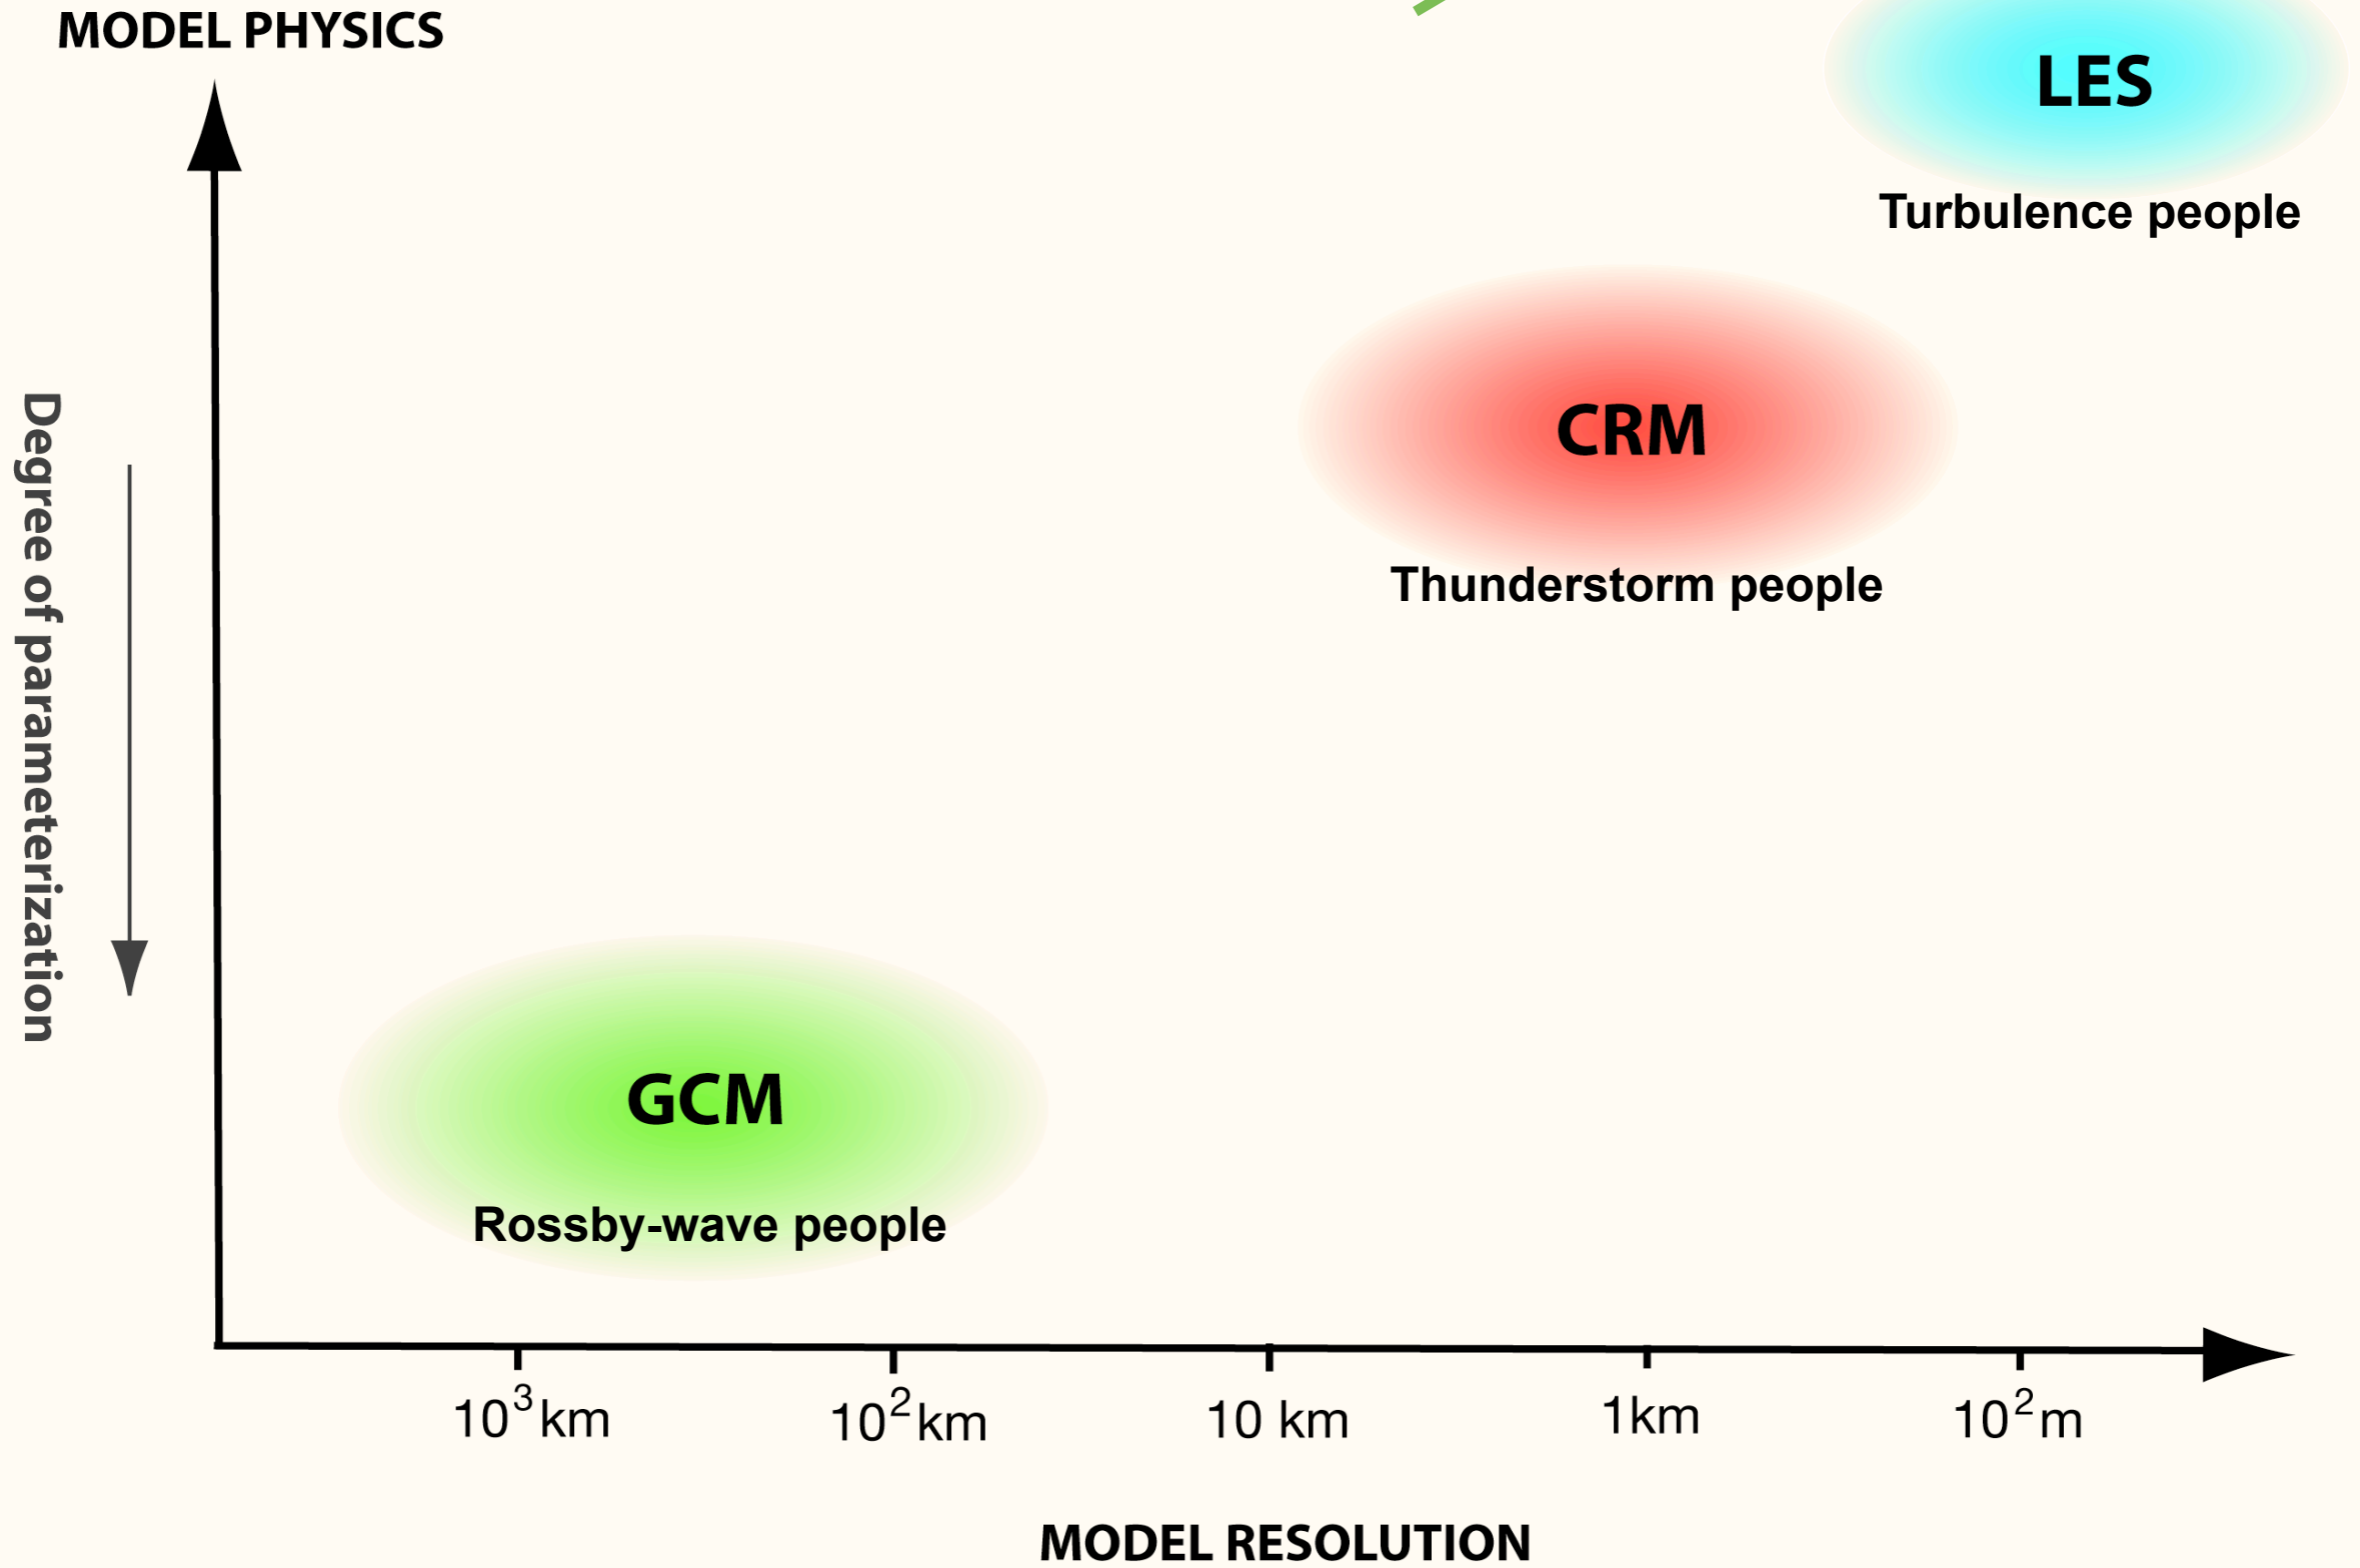

- **Prediction**
 - **NWP**
 - **Seasonal to interannual prediction**
 - **Climate change simulations**
- **Academic applications**
 - **Numerical experiments (e.g., what Isaac Held showed)**
 - **Synthesis**
 - **Learning by coupling -- Lots of interesting questions arise**
 - **Interdisciplinary connections**

The GCM as Scientific Water Hole

THREE FAMILIES OF MODELS

people

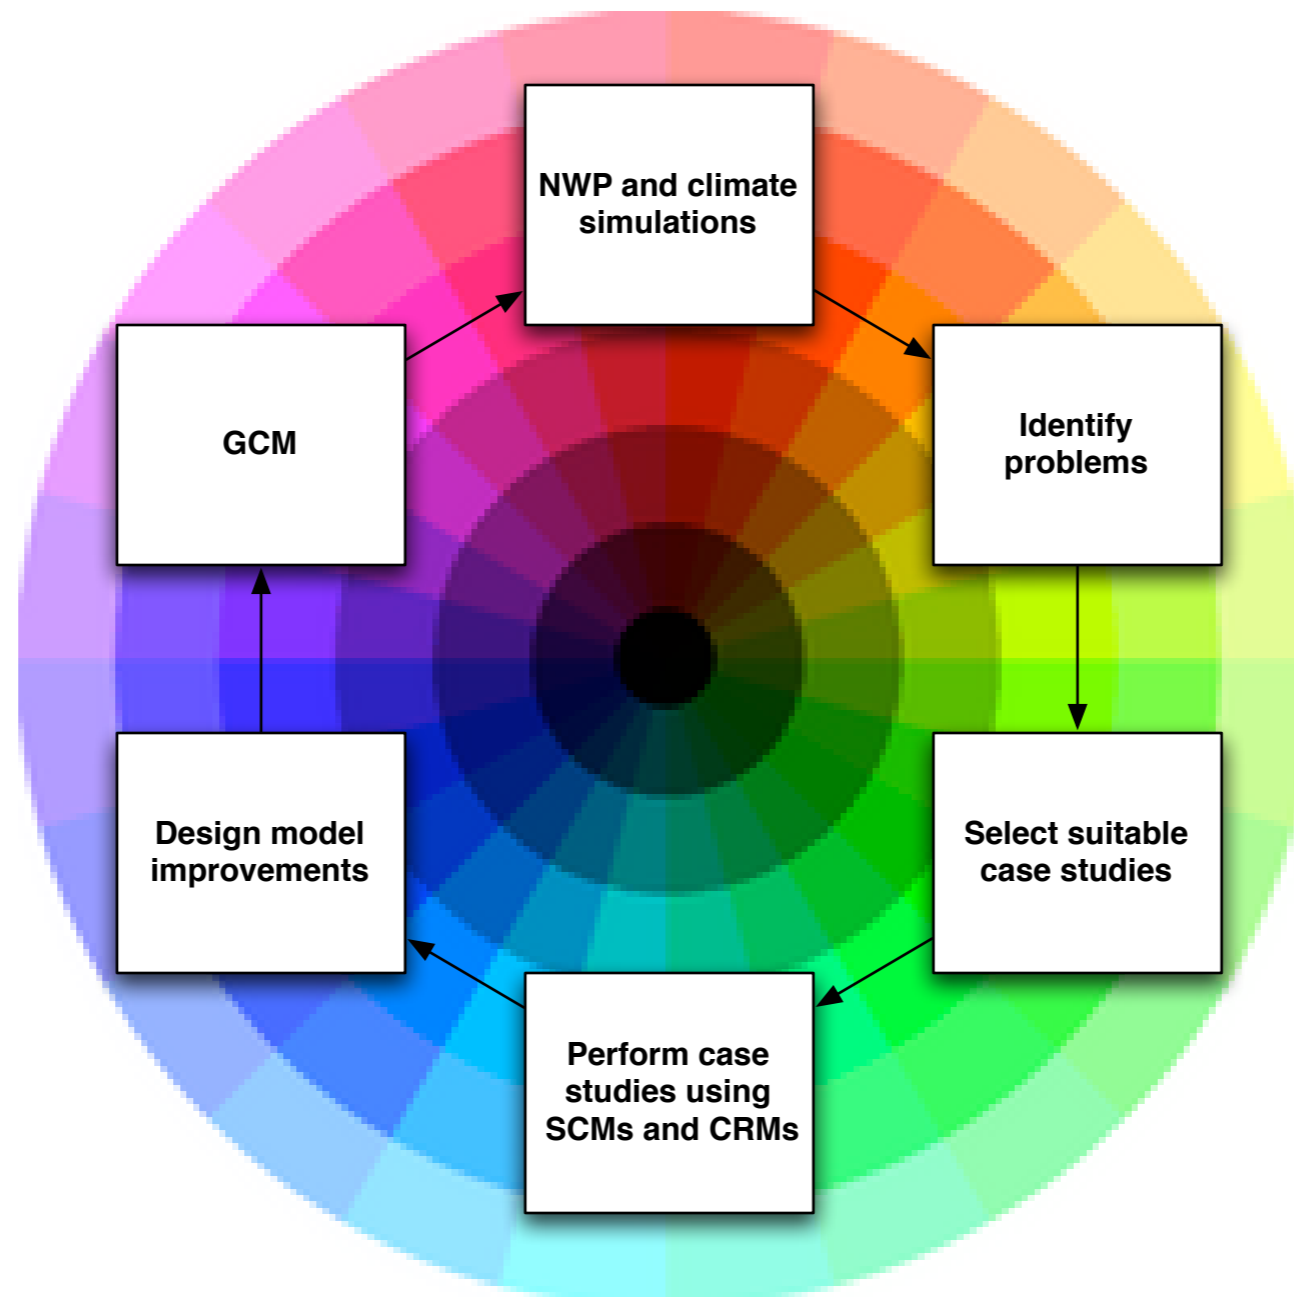

A Disconnect at the Water Hole

- **What cloud-observers measure, GCMs don't simulate.**
- **What cloud-resolving models simulate, GCMs don't simulate.**

Addressing the disconnect

- ◆ **Tests with SCMs, CRMs, and LESMs, through case studies based on field experiments**
- ◆ **A harmonic convergence of GCMs and CRMs**

Lamentations

(A short list of problems with current cloud parameterizations)

- **Statistics of cloud-dynamical processes are inadequately understood.**
 - ★ **“Closures”**
 - ★ **“Triggering”**
 - ★ **Mesoscale organization**
- **Microphysics is very rudimentary.**
 - ★ **Required input is not available.**
 - ★ **Basic understanding is weak, esp for ice clouds.**

Working together to solve the cloud problem

Applied Mathematicians

Atmospheric Scientists

Step back.

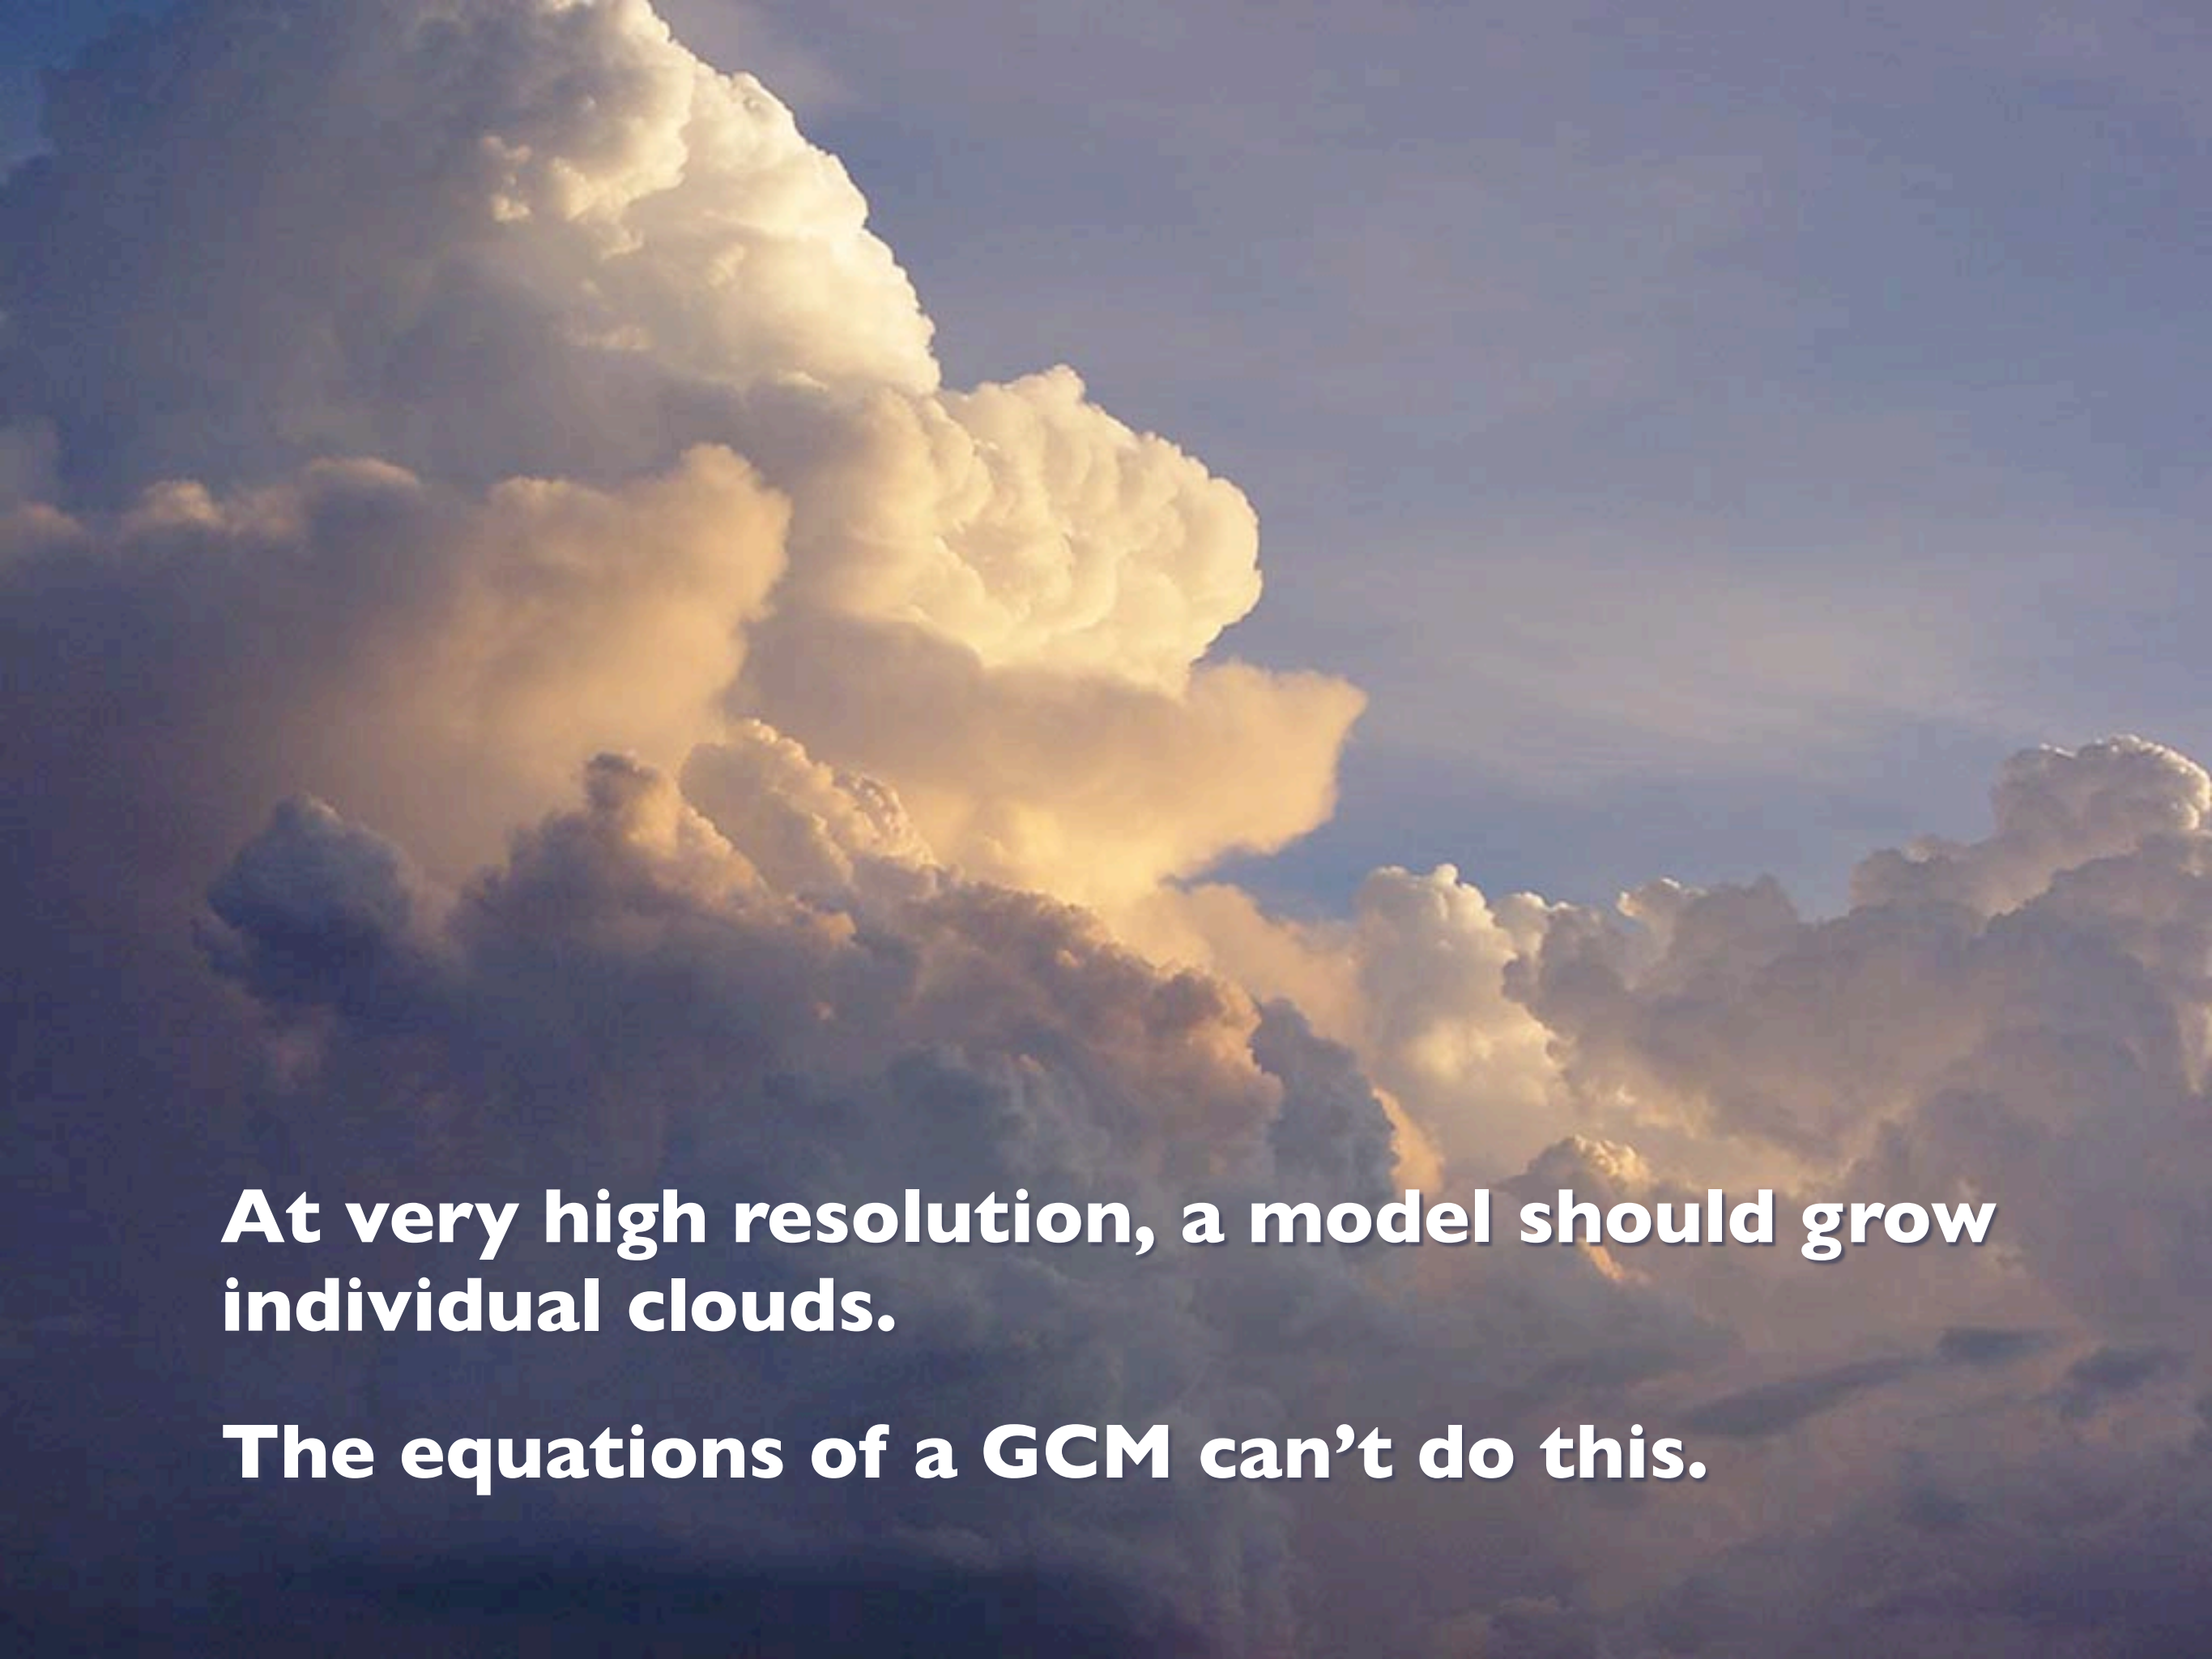

There have been no *revolutionary* changes in climate model design since the 1970s.

Meanwhile, computing power has increased by a factor of a *million*.

The CRAY-1 S Series of Computers

Cray Research, Inc.

At very high resolution, a model should grow individual clouds.

The equations of a GCM can't do this.

Cloud-Resolving Models

Partial differential equations --> Clouds

***A cloud simulation performed with a CSRM,
as viewed from space***

Note the wide range of spatial scales in the cloud system.

Limitations of CSRMs

- ◆ **Microphysics must still be parameterized.**
- ◆ **Turbulence and shallow convection must still be parameterized.**
- ◆ **Radiative transfer must still be parameterized.**

Strengths of CSRMs

With a CSRМ, mesoscale and cloud-scale dynamics are explicitly simulated, so that microphysics, turbulence, and radiation become the “tall pegs.”

- ◆ **A CSRМ is a much better framework for microphysics parameterization than a GCM.**
- ◆ **A CSRМ is a much better framework for turbulence parameterization than a GCM.**
- ◆ **A CSRМ is a much better framework for radiation parameterization than a GCM.**

Dreaming of a global CRM (GCRM)

Current climate-simulation models typically have on the order of 10^4 grid columns, averaging about 200 km wide.

A global model with grid cells 2 km wide will have about 10^8 grid columns. The time step will have to be roughly 10^2 times shorter than in current climate models.

The CPU requirements will thus be $10^4 \times 10^2 = 10^6$ times larger than with today's lower-resolution models.

A dream no more.

Our friends at the Frontier Research Center for Global Change, in Japan, are helping us to find the path forward.

They are helping us in much the same way that Toyota helped General Motors.

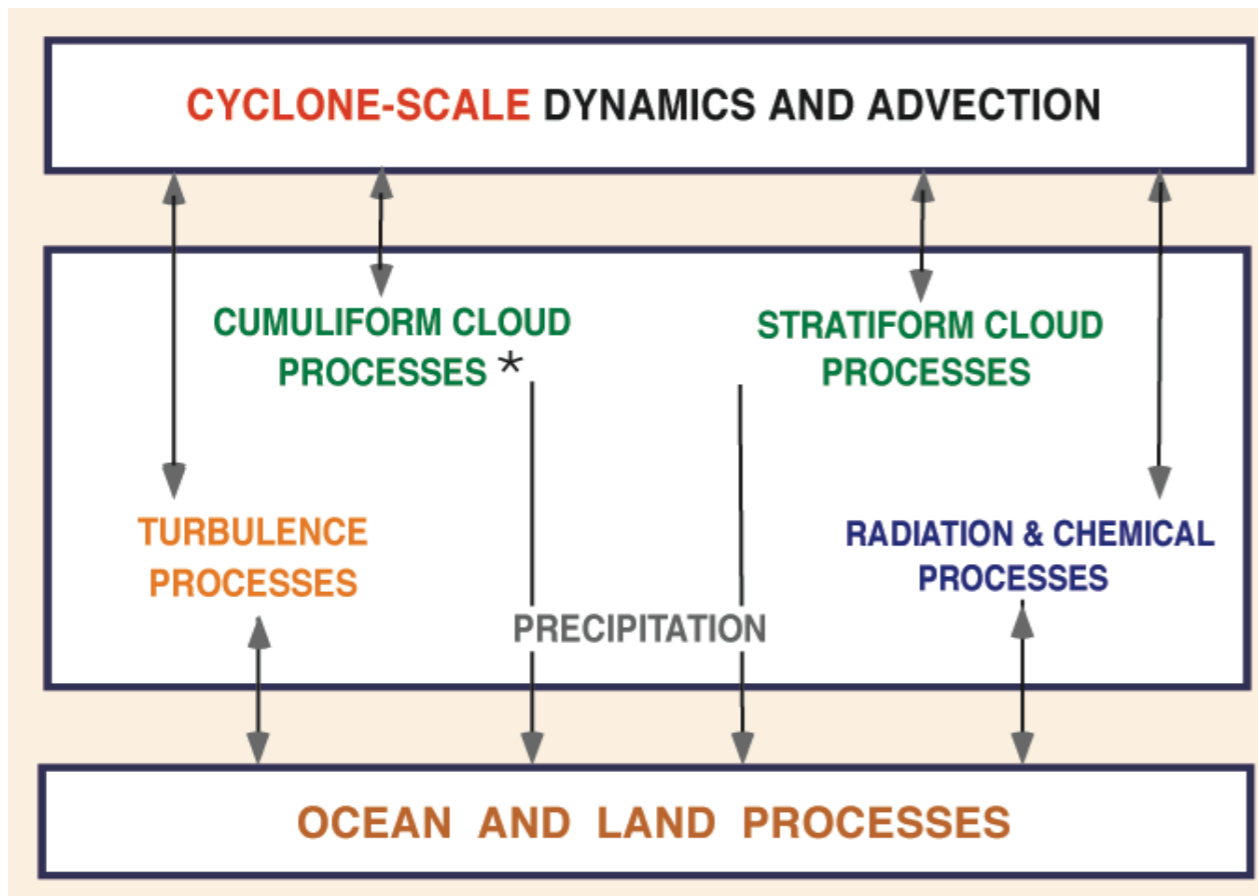

**Figure from
Hiroaki Miura**

The World's First GCRM

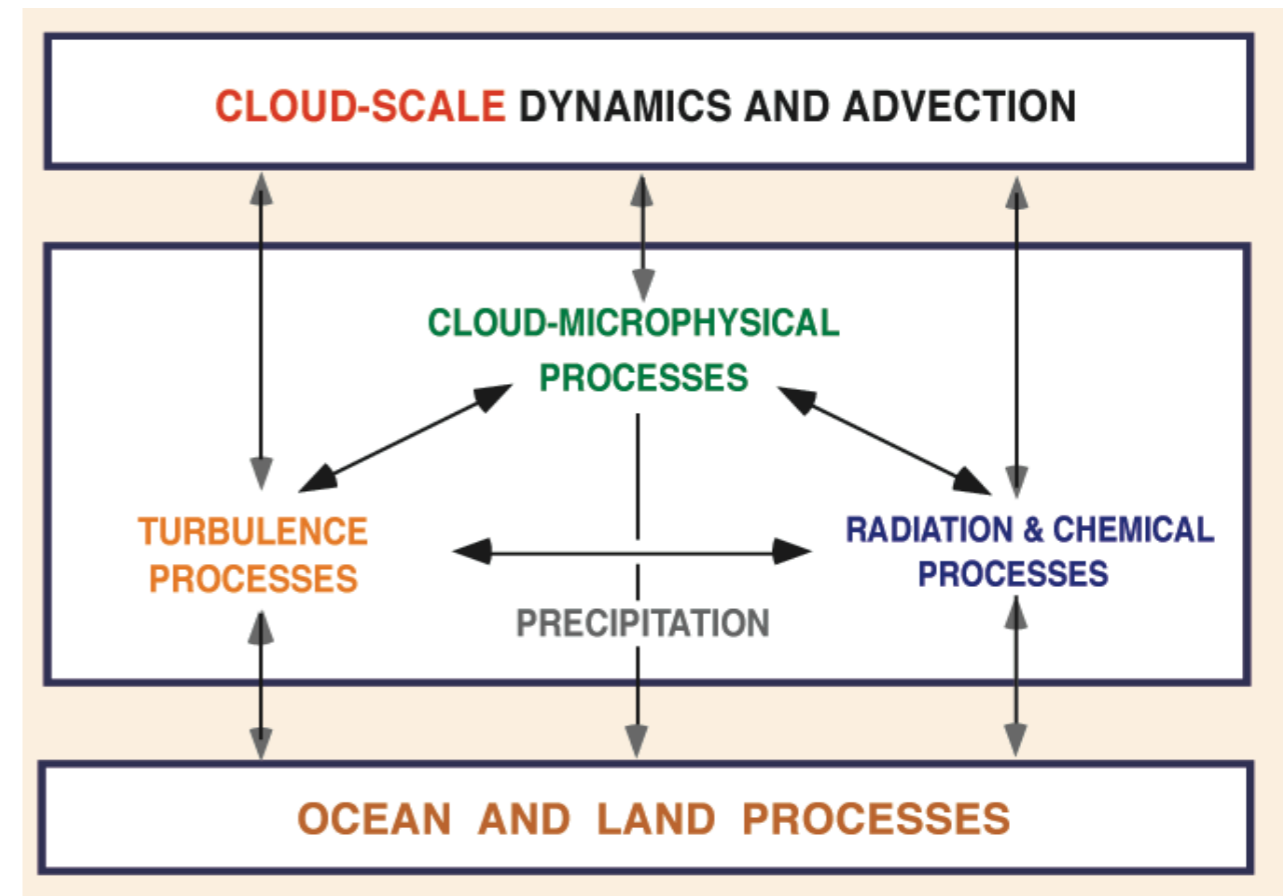

- **3.5 km cell size, $\sim 10^7$ columns**
- **Top at 40 km**
- **54 layers, $\sim 10^9$ total cells**
- **State ~ 1 TB**
- **15-second time step**
- **~ 10 simulated days per day on half of the Earth Simulator (2560 CPUs, 320 nodes), close to 10 real TF.**
- **~ 1 TF-day per simulated day**

Physical interactions

Conventional GCM

GCRM

Applications of GCRMs

- **Parameterization development**
 - **For the first time, we will be able to simulate interactions from the global scale to the cloud scale.**
- **Numerical weather prediction**
- **Climate simulation**
 - **An annual cycle, coupled to the ocean, by 2011**
 - **Time slices**
 - **Anthropogenic climate change**

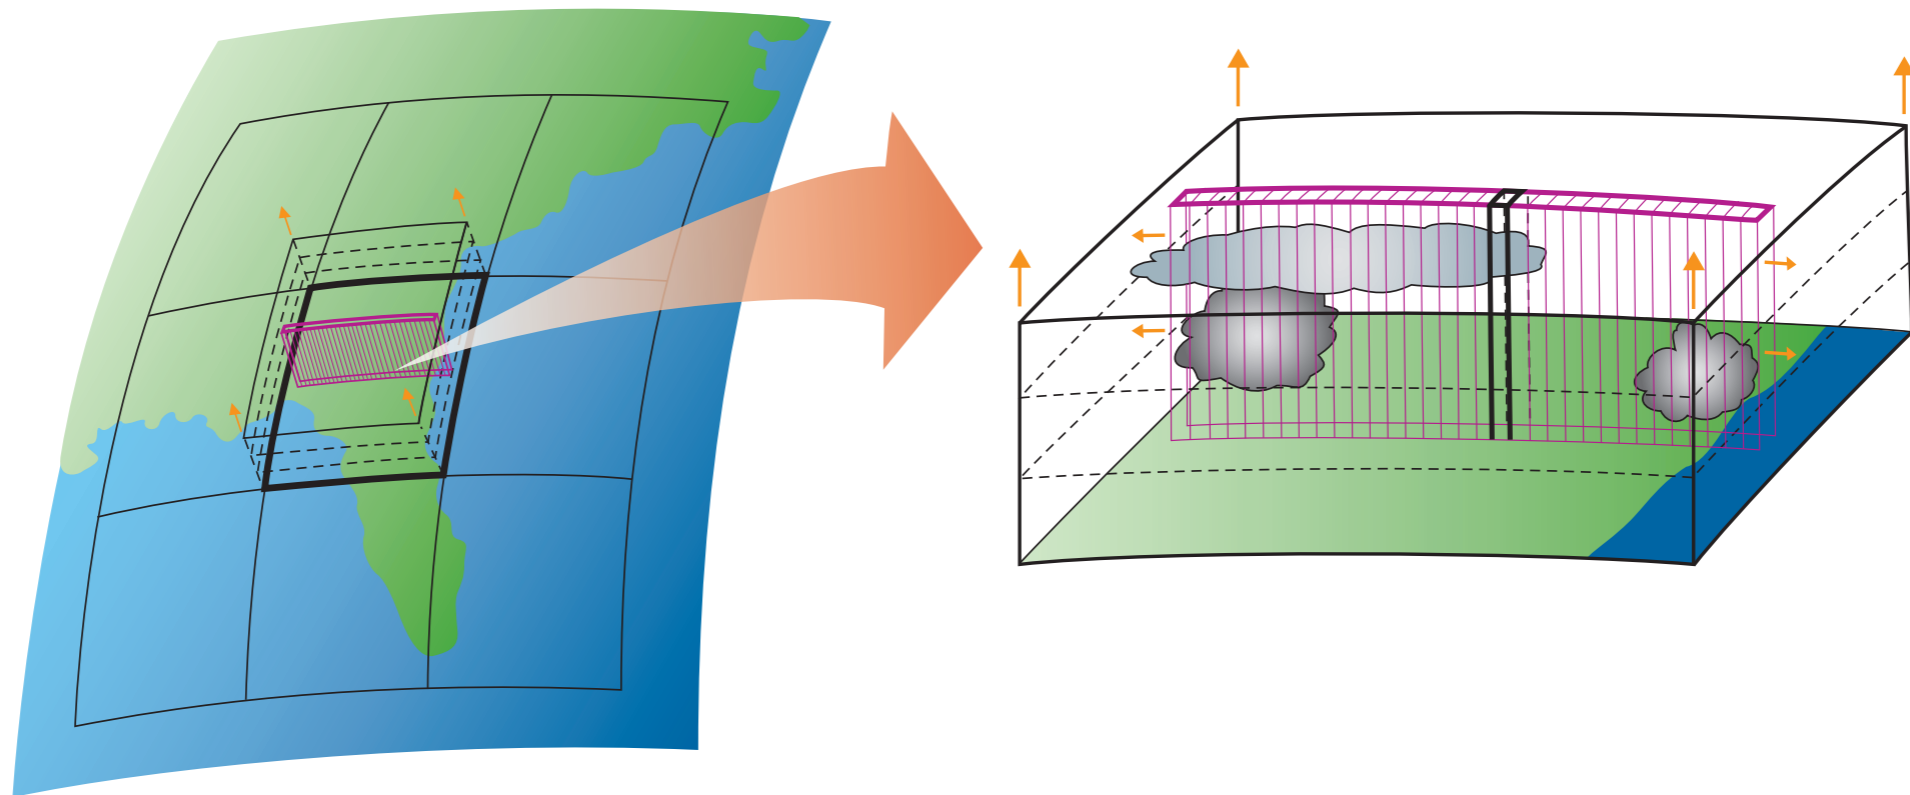

A bridge to GCRM climate simulation

**Current
climate
models**

**GCRM
climate**

Super-Parameterization (aka MMF)

This idea was proposed and first tested by Wojciech Grabowski.

Compared to what?

Super-Parameterizations	Conventional Parameterizations
2D or Quasi-3D	1D
Periodic boundary conditions	Boundary whats?
Shallow convection and turbulence must be parameterized.	Same
Microphysics is simplified but the required input is in pretty good shape.	Microphysics even simpler, and the required input (e.g., local vertical velocity) is not available.

“It’s low-resolution, but at least it uses the right equations.”

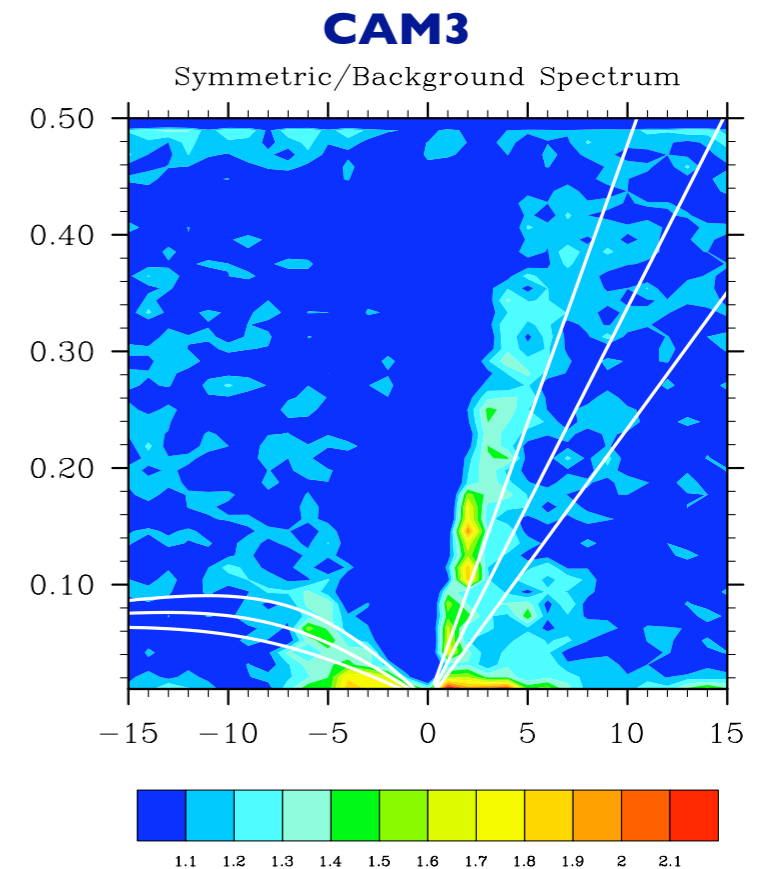

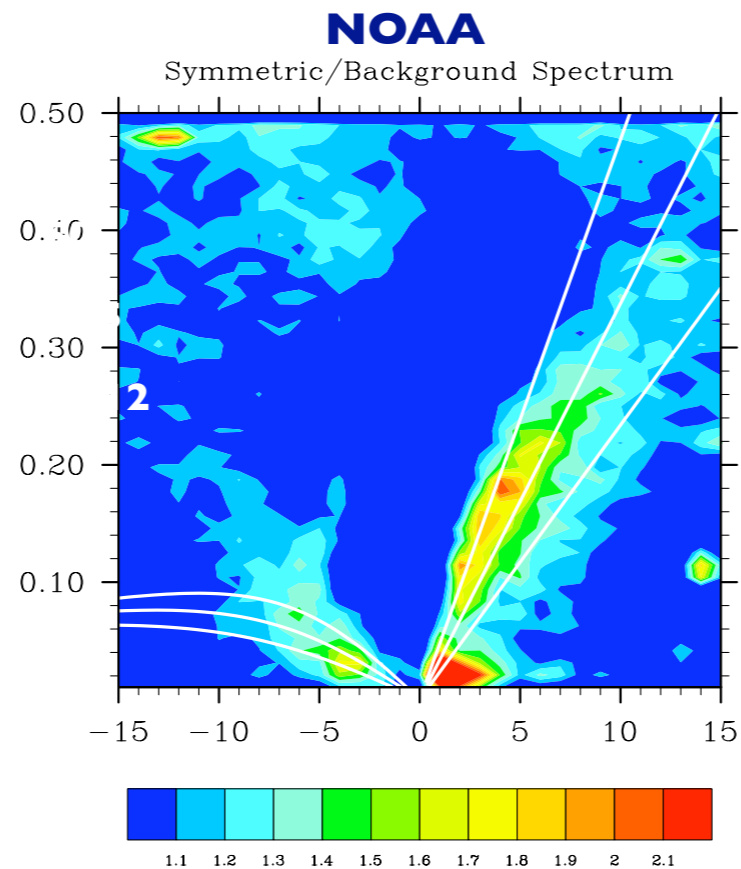

-- Bjorn Stevens

Radiatively driven turbulence below cloud top

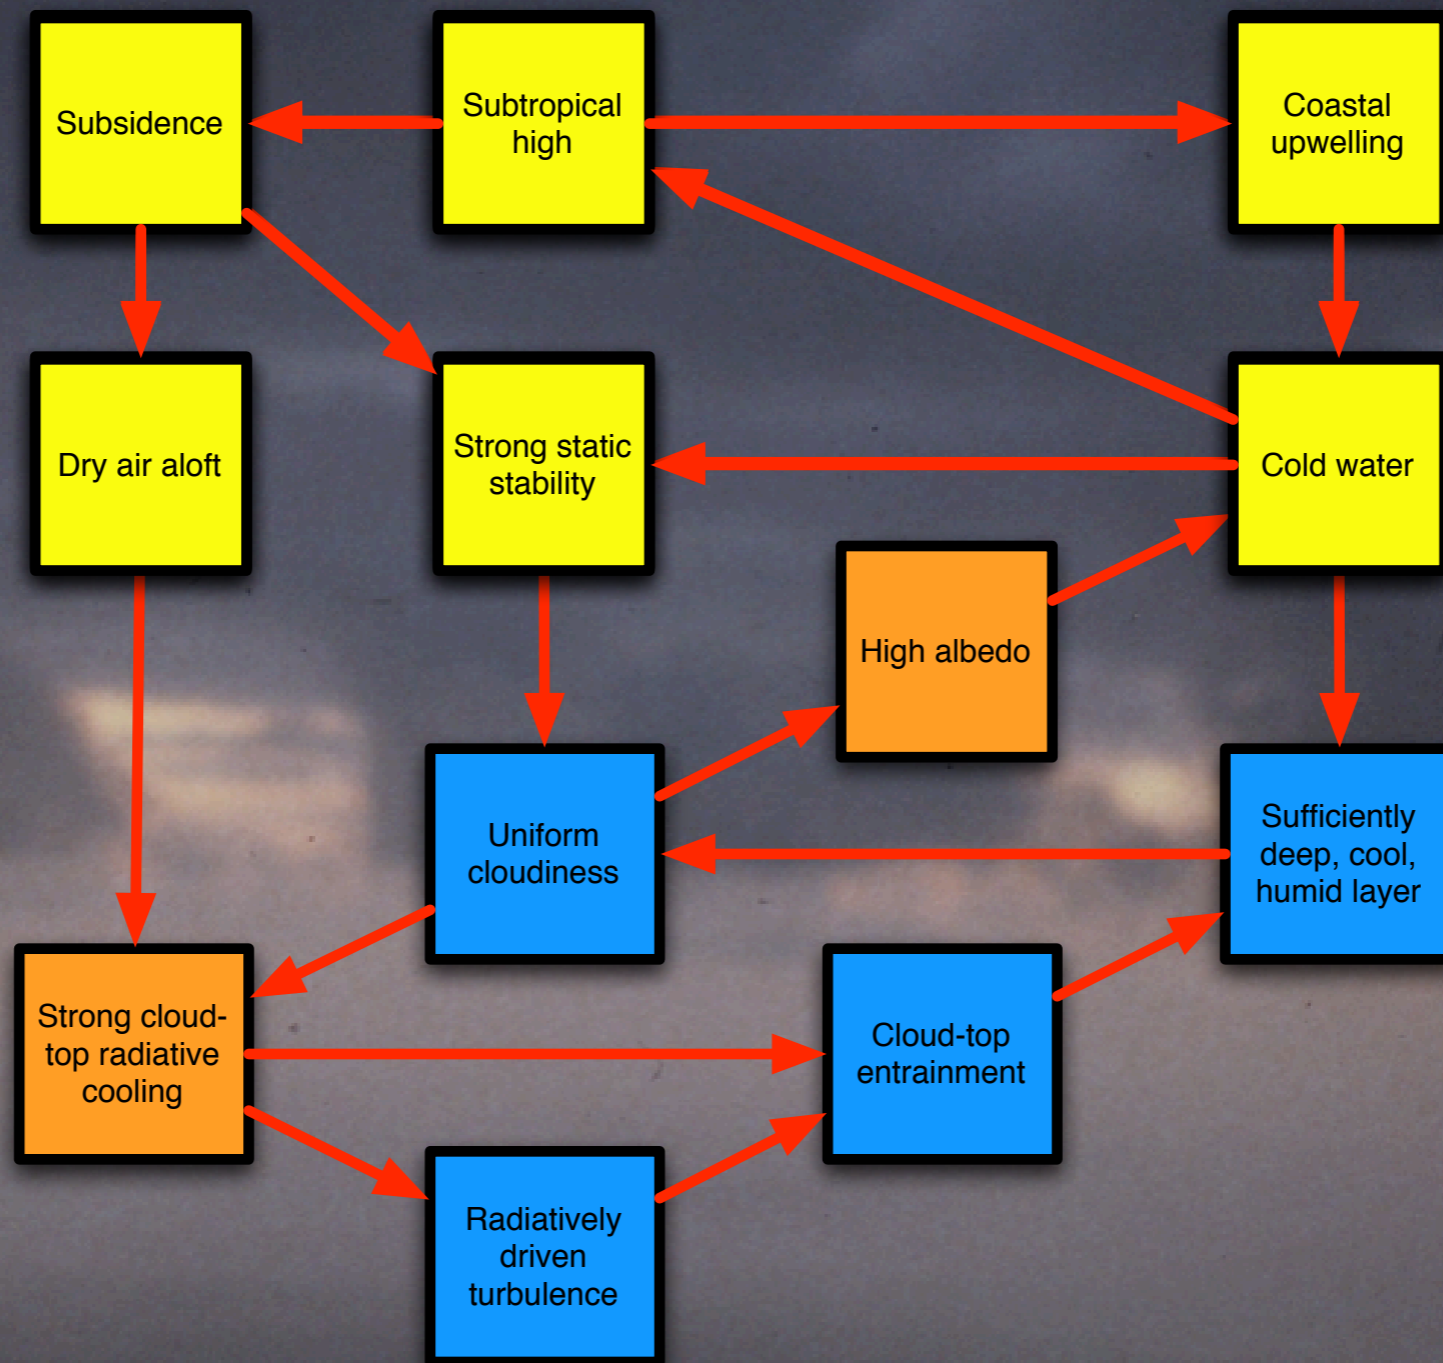

The Klein Line

Stratus Cloud Amount vs. Stability

The Klein Line

- **Physical explanation**
 - **Strong inversion inhibits mixing with dry air above, thus protecting the cloud**
 - **Details are complicated and controversial**
- **Input or output?**
 - **Klein line is macroscopic relationship**
 - **Parameterizations should represent microscopic processes**
 - **Klein line should be predicted, not built in by assumption**

Making sausage

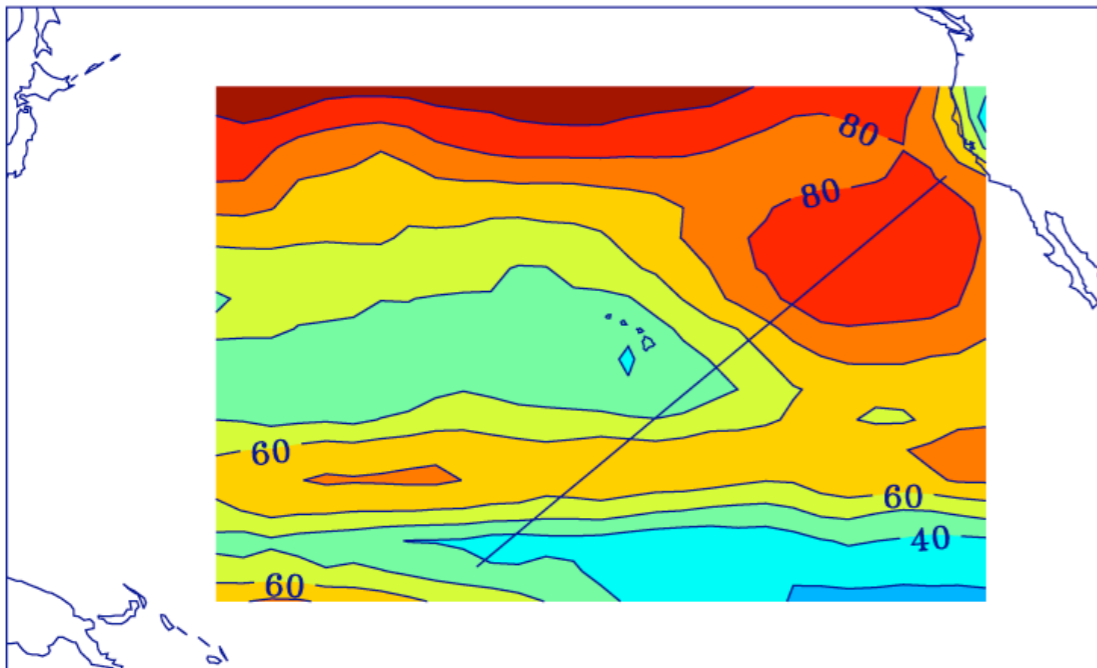

CAM3

MMF

ISCCP

Which simulation is better?

How do the two models produce marine Sc clouds?

◆ Standard CAM

Cloud is assumed to be located in the model layer below the strongest stability jump between 750 mb and the surface. If no two layers present a stability in excess of -0.125 K/mb , no cloud is diagnosed.

▲ *Klein Line is built in*

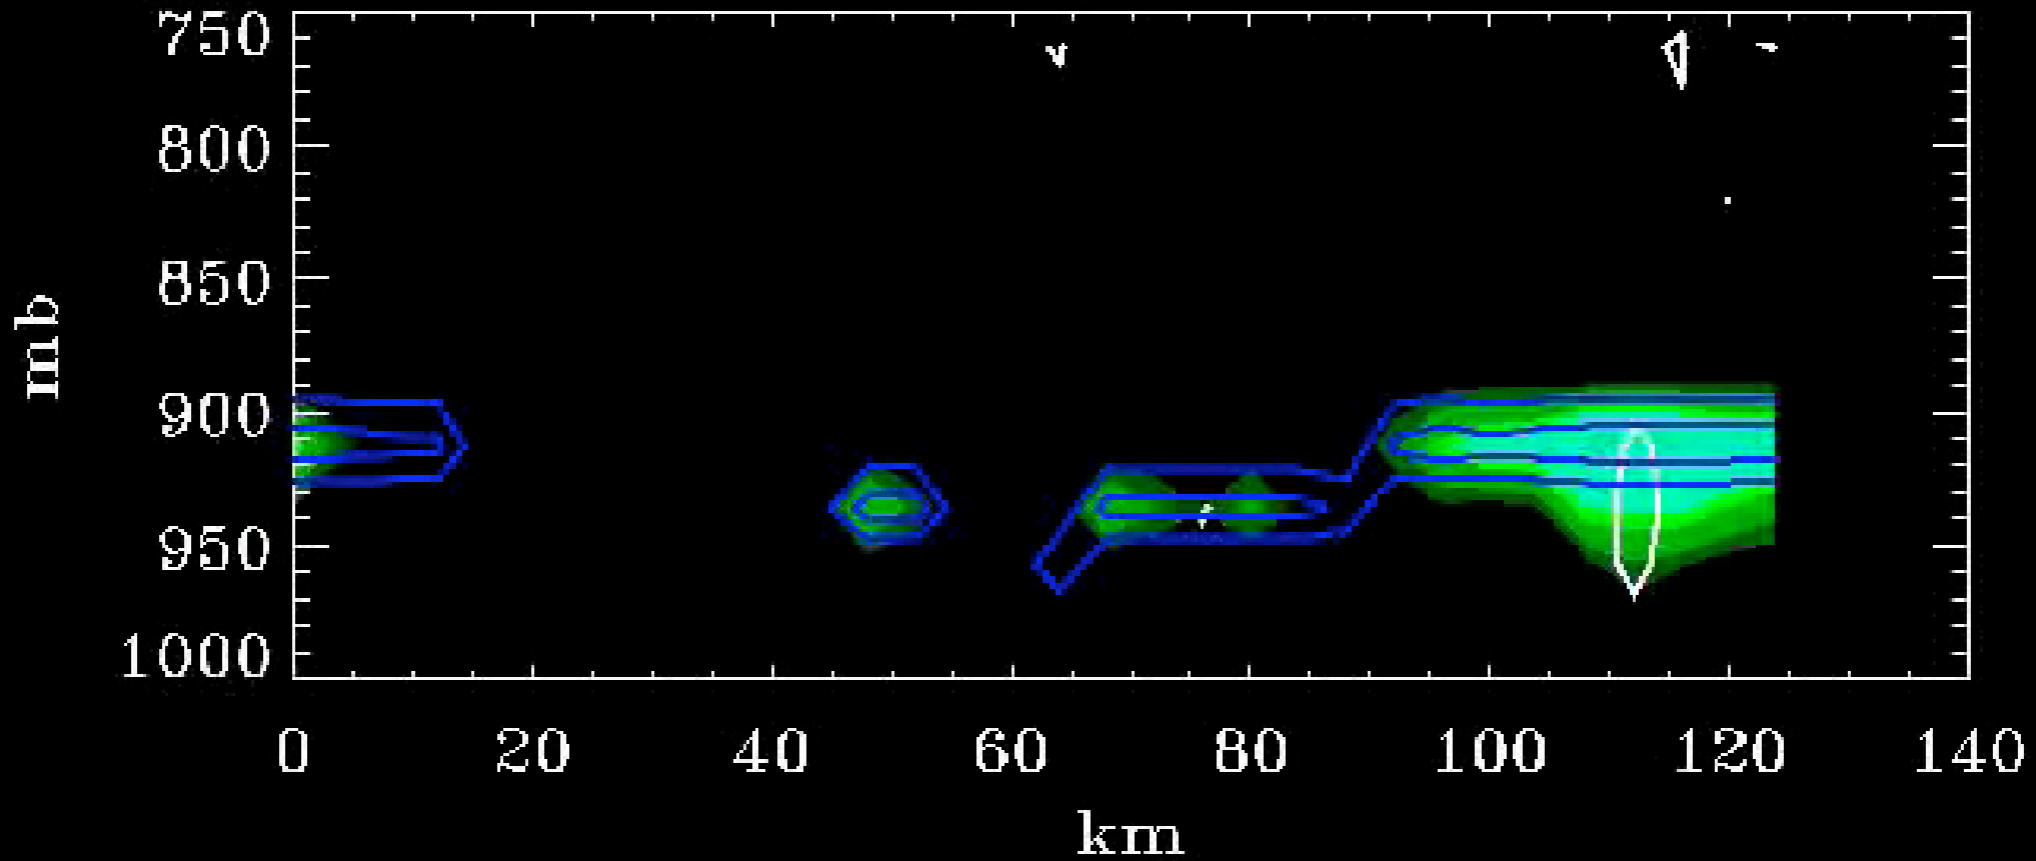

▲ *No information about moisture content!*

◆ Super-CAM

Simply solves the right equations with low resolution.

Concluding Remarks

- **GCRMs and MMFs make it possible for cloud observers and GCM developers to compare apples with apples.**
- **When something doesn't work in a GCRM or an MMF, we can "look inside" to see how the simulation compares with observations.**
- **Focused efforts are under way to develop improved parameterizations for cloud-resolving models.**
- **Focused efforts are under way to develop a radically improved second-generation MMF.**
- **GCRMs are just appearing, but have a bright future.**
