(Thomas White, CFEL)

When should I move onto the Next Sample?

- Beamtime is scarce!
- Critical live feedback:
 - Does the beam hit the sample?
 - Do we see crystals?
 - Does the data make sense?
 - What is the quality of the data?
- Can I move on to the next sample?

XFEL structures reveal why thiorene is not photo-active

Schriber EA, Paley DW *et. al.* (2021) "Chemical Crystallography by Serial Femtosecond X-ray Diffraction." Nature **601**, 360-365.

How is the NERSC + LCLS Superfacility Used?

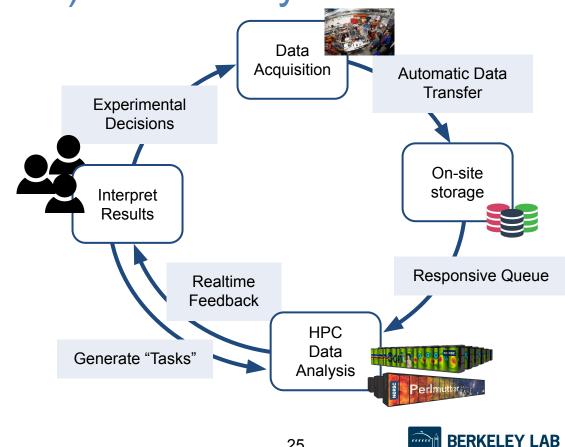

How is the NERSC + LCLS Superfacility Used?

- Difficult to define what "interactivity" means
 - Eg: Interactive can mean exploration, vs human-in-the-loop
 - Each use HPC differently
- ExaFEL: Case study of an interactive HPC workflow
- NERSC staff deploy code mine log files, and instrument workflows during runtime in order to monitor the whole workflow

(Realtime) Data Analysis Workflow

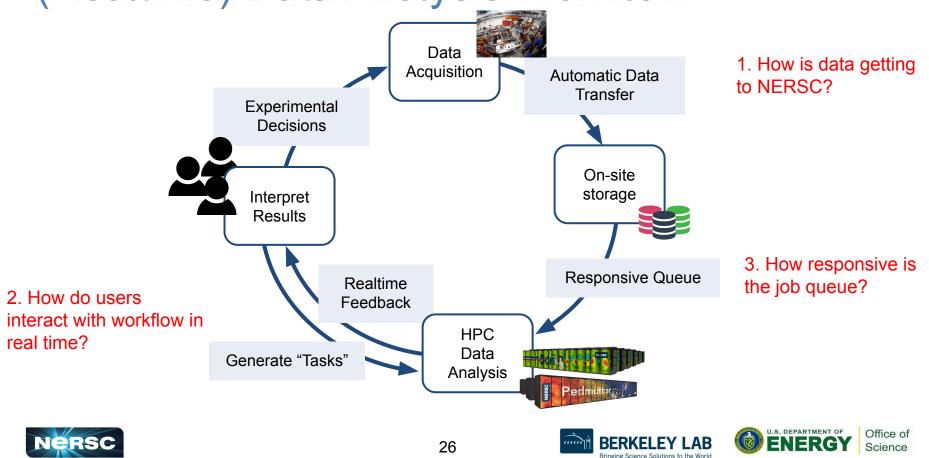

Bringing Science Solutions to the World

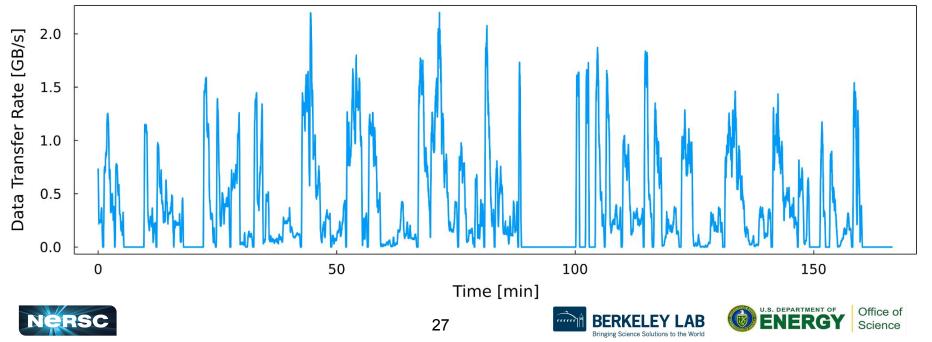

(Realtime) Data Analysis Workflow

1. How is Data Getting to NERSC?

 Files are automatically transferred using XRootD immediately after data is collected 15 TB/day

1. How is Data Getting to NERSC?

 Tail latency can disrupt the entire workflow!

 Choice of file system matters

2. How do Users Interact with the Workflow?

2. How do Users Interact with the Workflow?

- An HPC center bridges 3 time scales:
 - Hours => Experiment, Job Scheduler
 - Minutes => Humans
 - Milliseconds => Compute Nodes

- Objective: measure the human timescale
 - How much of the workflow requires "constant" human interaction?

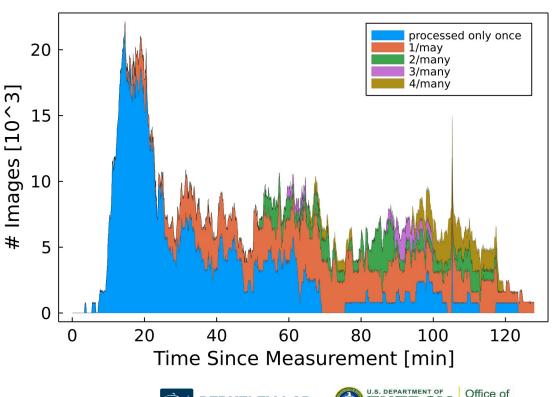

2. How do Users Interact with the Workflow?

- Most images are processed only once
 - This step can be automated once tuned

 Reprocessing as a "fingerprint" of interactivity #

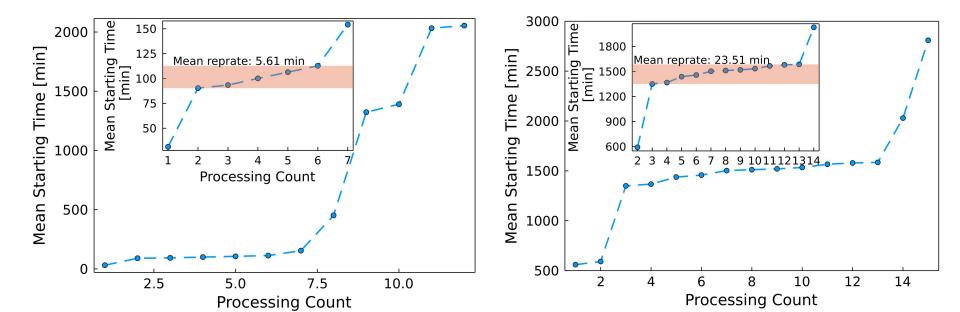

g Science Solutions to the World

Science

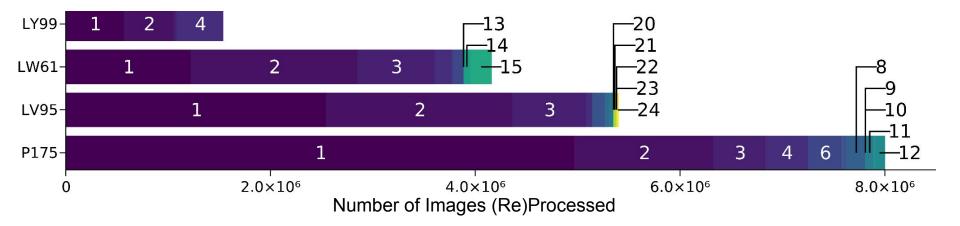

Interactive Engagement with Data Sets

- Repeated reprocessing indicates user is exploring data (troubleshooting?)
- Details different from experiment to experiment

Interactive Engagement with Data Sets

Every beamtime is unique!

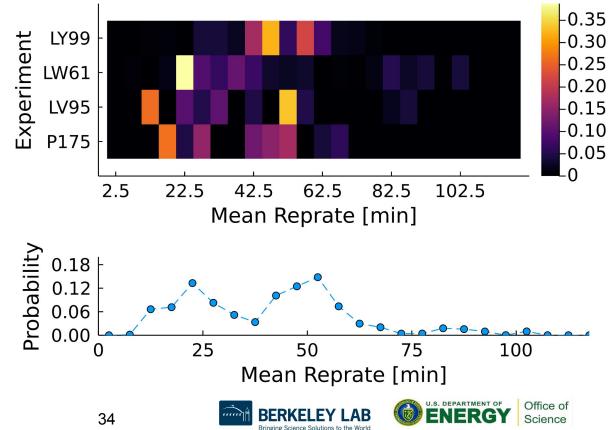

Only ~5 % of images reprocessed > 10x

Interactive Engagement with Data Sets

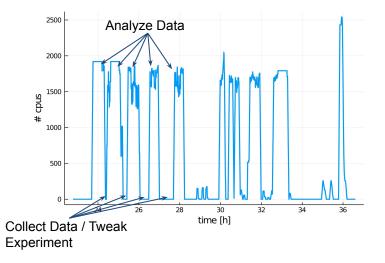

- Most reprocessing takes place on a 25-50 min cadence
- In line with the cadence of measurement runs at LCLS

3. How Responsive is the Job Queue?

- We don't know when data will need to be analyzed
- Once data is available, queue needs to respond ASAP

- Use reservations
 - o 60-80 Nodes
- Idle reservations "waste" compute => try sharing with preemptible jobs

Preemptible Reservations

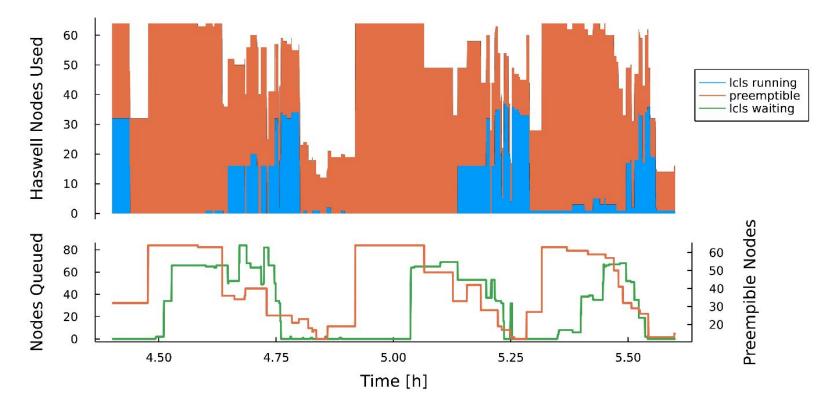

• Allow preemptible jobs to use reservation:

- MaxStartDelay=\${MINUTES}
 Eg:MaxStartDelay=5
- Make a job preemptible
 - #SBATCH --signal=R:INT@\${SECONDS}
 Eg.#SBATCH --signal=R:INT@300
- Jobs submitted to the regular QOS where:
 \$MINUTES * 60 >= \$SECONDS
 are allowed to run in the reservation
 - A job being preempted will receive SIGINT and then has \$SECONDS many seconds to shut down gracefully (before being killed)

Testing Preemptible Reservations

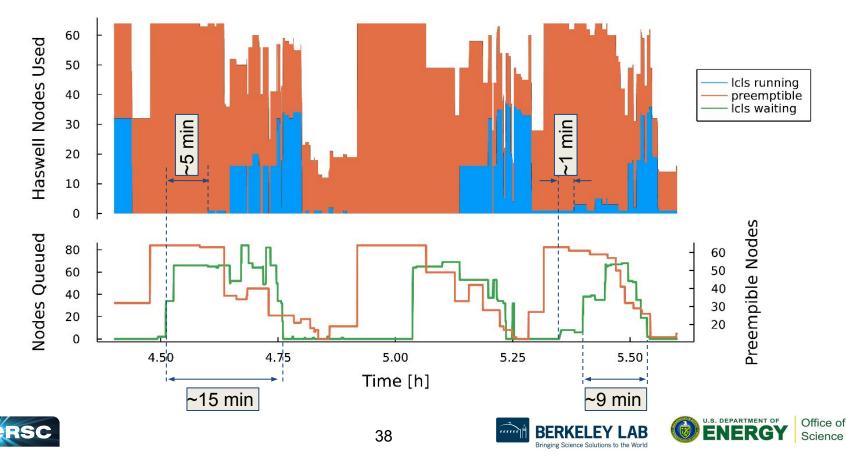

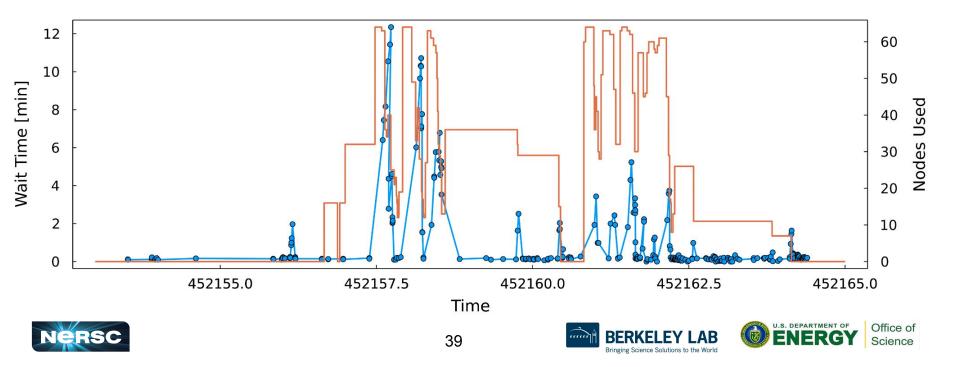

Testing Preemptible Reservations

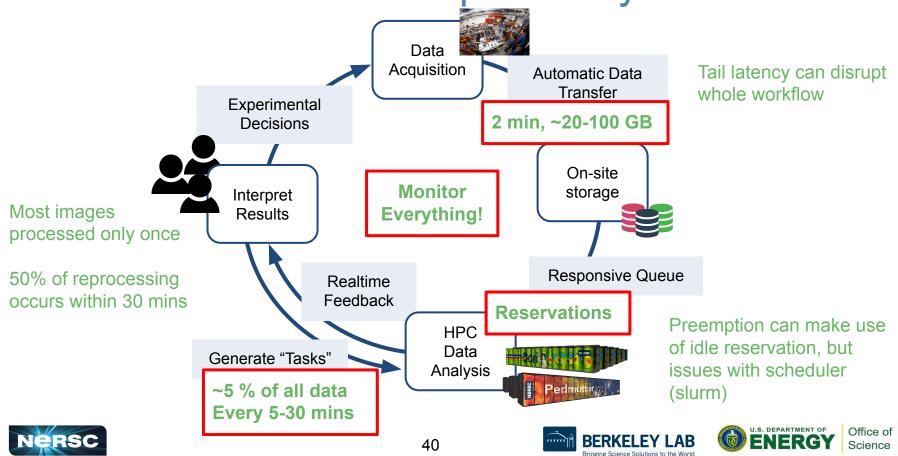

Testing Preemptible Reservations

Preemptible jobs don't leave reservation quickly enough

Conclusion: XFEL + Superfacility

Engineering Nuts and Bolts: Performance Optimization Towards the Exascale

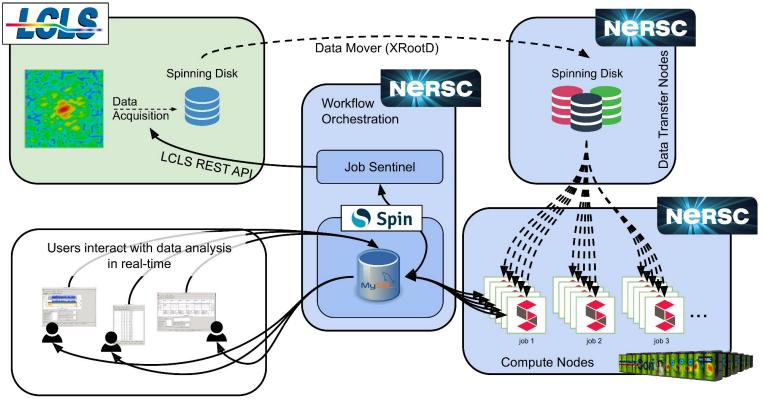

Deploying CCTBX at NERSC

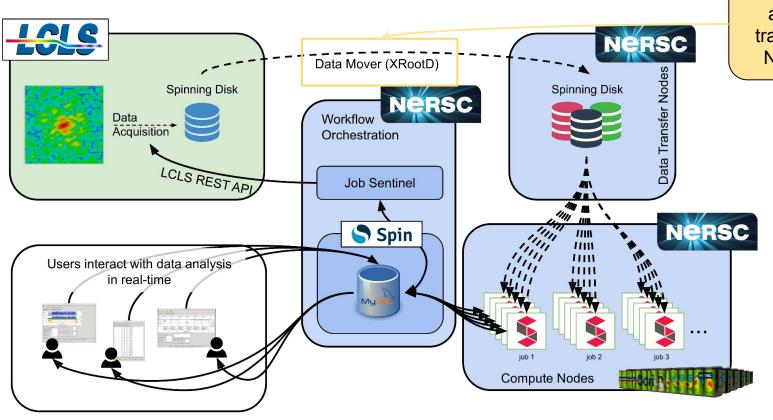

XRootD automatically transfers data to NERSC DTNs

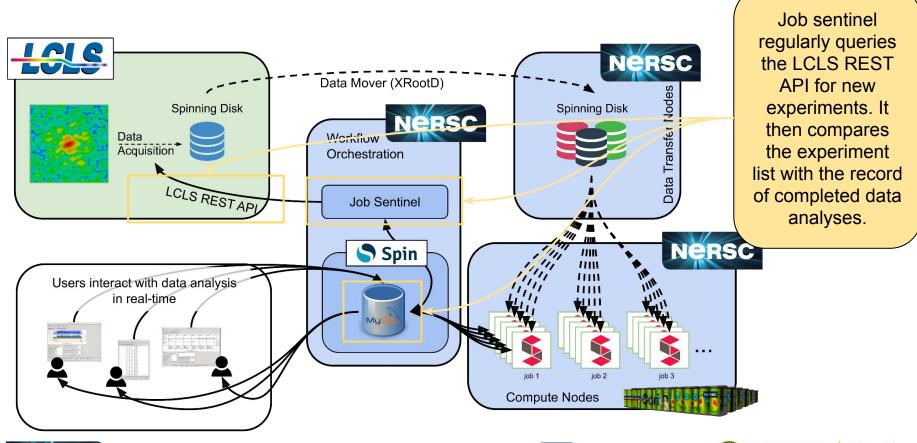

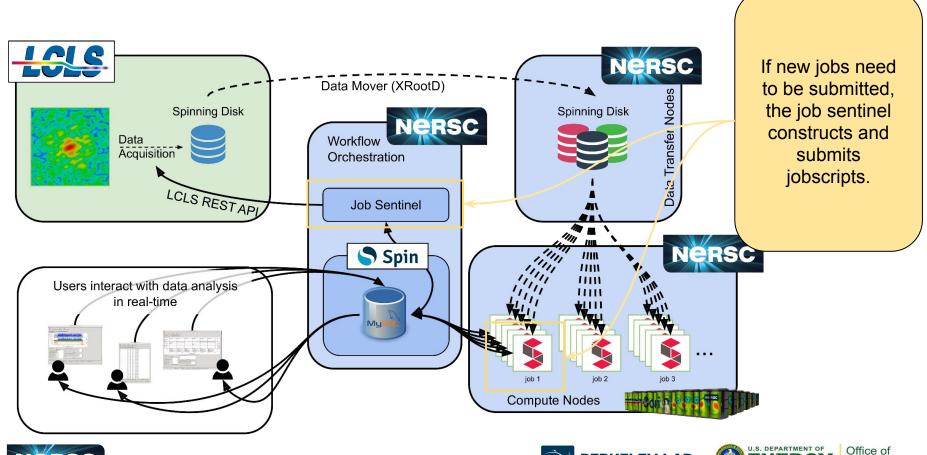

Office of Science

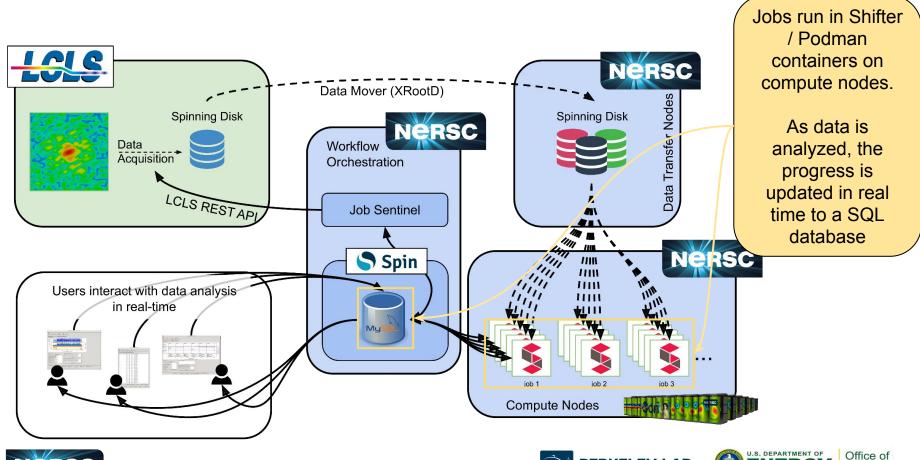

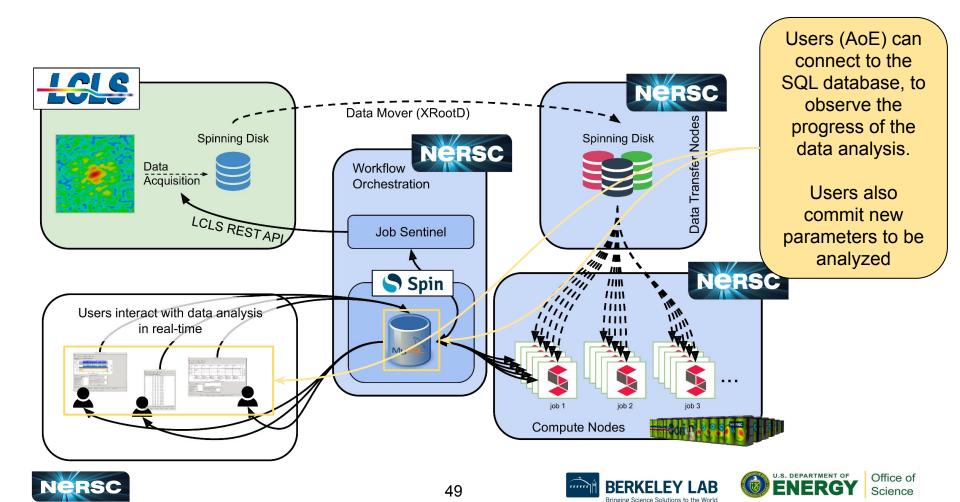

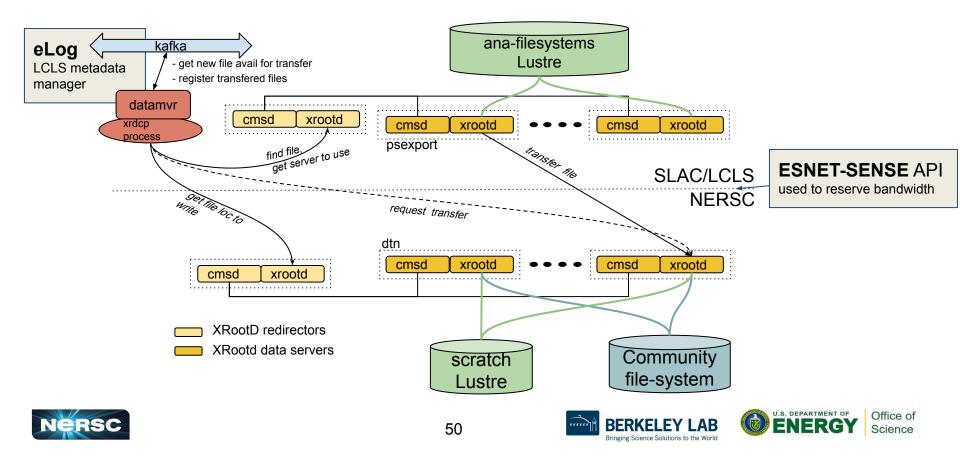

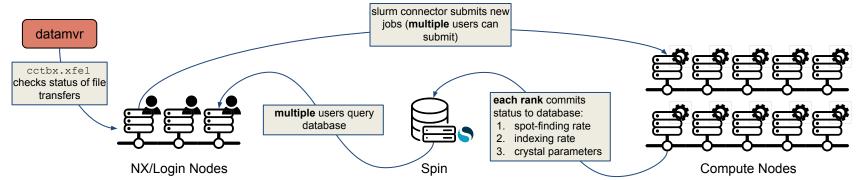

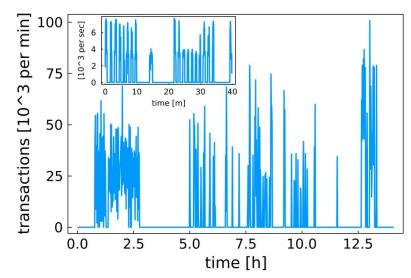

Data Movement XRootD clusters

Workflow Coordination hosted on Spin

- Spin was capable of handling over 7k transactions/sec
- Transactions and connections need to be pooled when exceeding 4000 connections (ranks)

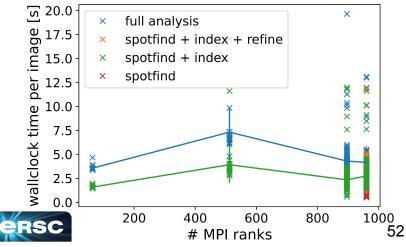

Data Analysis

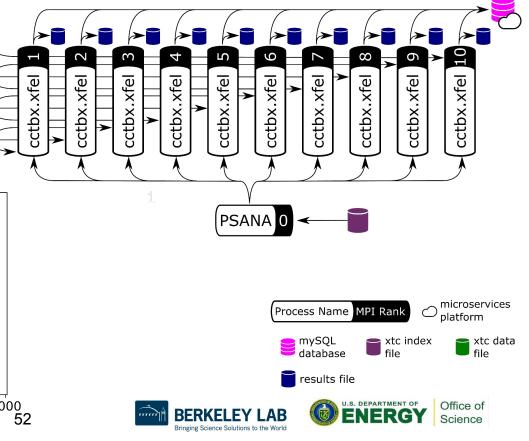

- Data analysis follows sequential stages:
 - spotfinding indexing Bragg spots

Reprocessing

- model refinement
- integrating Bragg spots

ustre Filesystem

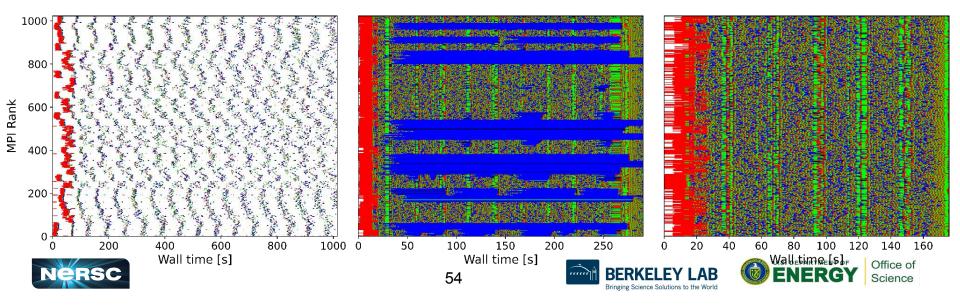

Performance Optimization For The Exascale

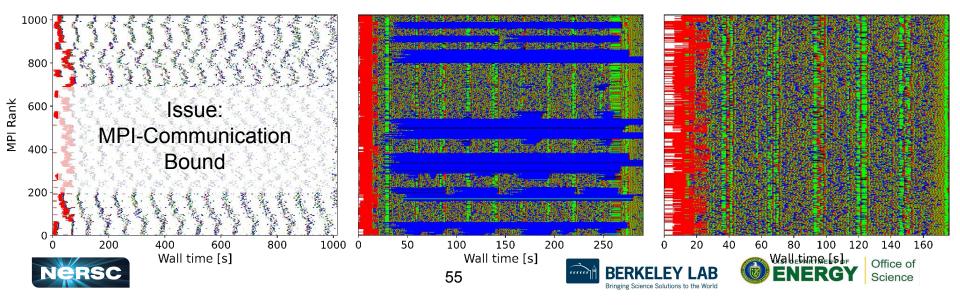

- Computational Weatherplot:
 - Each line shows work done by one MPI rank
 - There is no "the cctbx.xfel workload"

Start-Up and I/O (PSANA)
Spot Detection (DIALS)
Indexing (DIALS)
Refinement (DIALS)
Integrating (DIALS)

Performance Portability

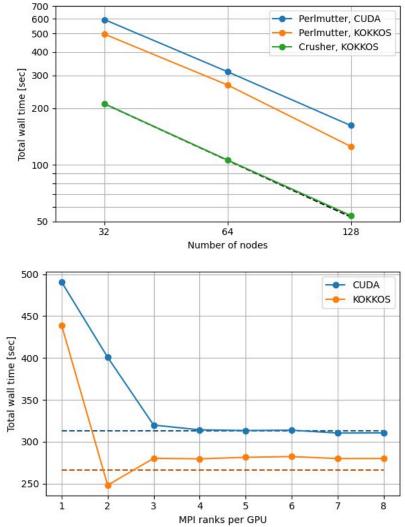

- Use Kokkos (<u>https://github.com/kokkos</u>) to generate code for each architecture
- Kokkos kernel abstractions are hardware independent

Performance Portability

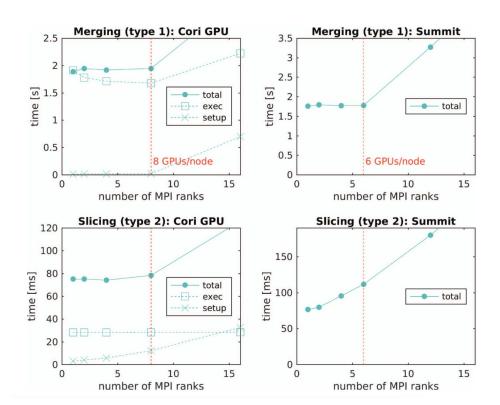

- Kokkos-generated code outperformed original CUDA kernels
 - Kokkoss generated kernels better at filling available resources on GPU
- Hide workflow and I/O latency by sharing GPU among several MPI ranks
 Ideal number of ranks/GPU depend on
 - how much of the GPU each kernel can use

Special Issue of the 2021/2022 Cray User Group Conference (CUG 2021/2022), Concurrency and Computation: Practice and Experience

Vendors + Libraries

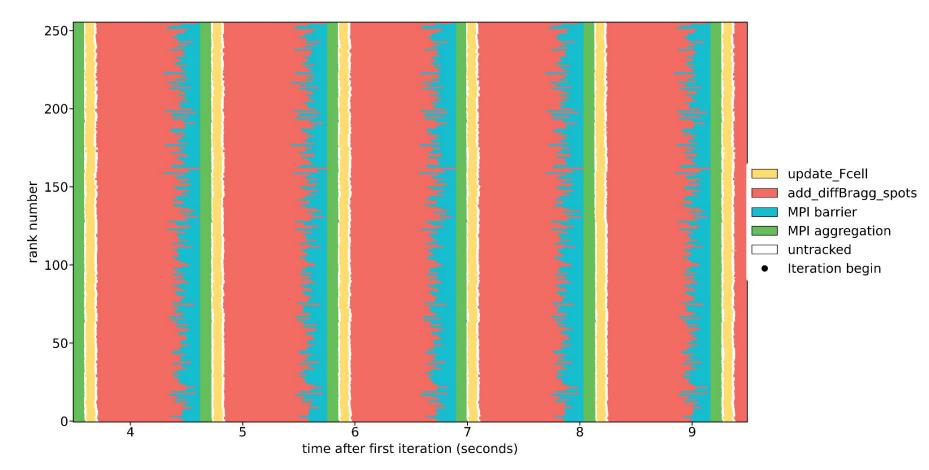

- Kokkos does not provide portable interfaces to vendor libraries (eg. cuBLAS, cuFFT/ rockBLAS, rocFFT)
- Requires active engagements with vendors and developer community to design portable and performant libraries
- https://github.com/elliottslaughter/cufinufft
- https://github.com/JBlaschke/PybindGPU

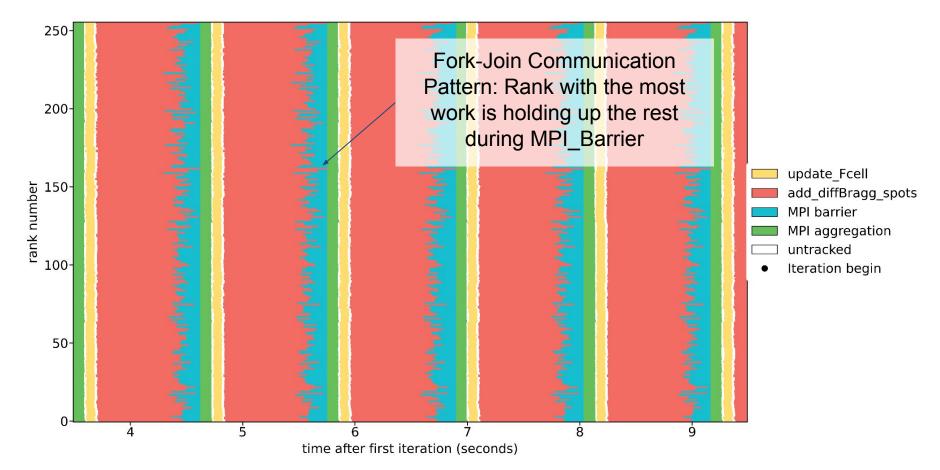

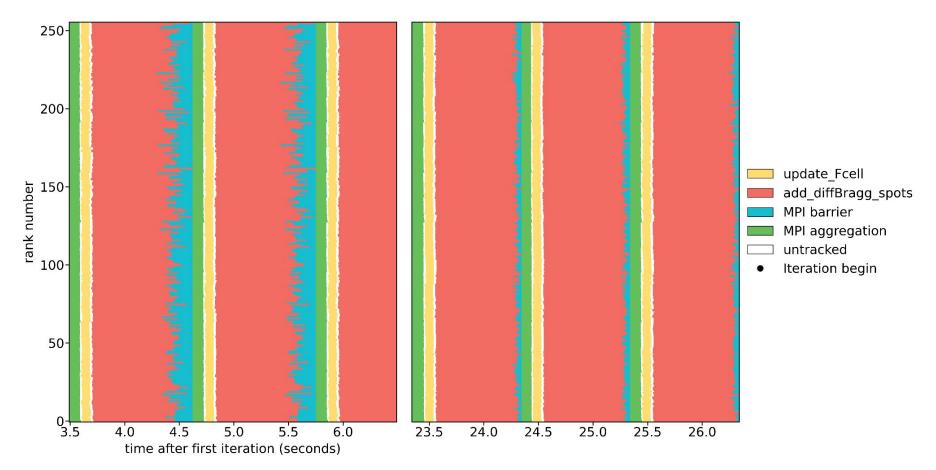

https://arxiv.org/abs/2102.08463

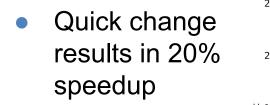

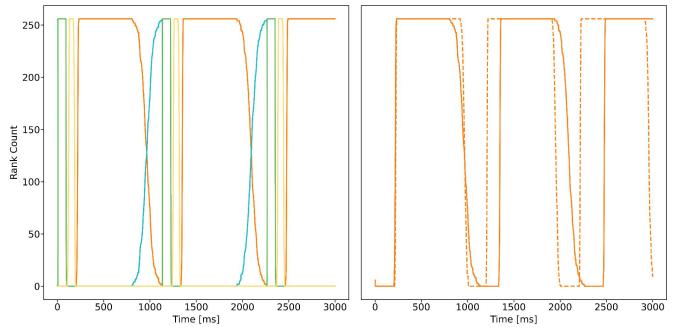

• Simple heuristic load-balancing (based on number of active pixels) results in very good load balancing

Lesson Learned: Performance + Portability Planning Packaging

Priority Packets

Performance + Portability

- When developing code of HW accelerators:
 - Keep portability a high priority: <u>https://github.com/kokkos/kokkos</u>
 - Kernel abstractions are a useful tool for getting good performance out of unfamiliar hardware (on a budget)
- Measure Everything! (profiling, debugging, tail latencies)
 - Instrumentation libraries (e.g. <u>https://github.com/LLNL/GOTCHA</u>, <u>https://github.com/NERSC/timemory</u>) do this with minimal effort
 - Workflow managers come with some monitoring tools out of the box
- Fast Feedback!
 - Measured performance data needs to communicated to users in a timely manner
- Porting ExaFEL is still a high-touch effort

Planning: Workflow Coordination

- New class of workflows include multiple data processing steps -Central scalable management and persistent state becomes necessary
 - Often hosted on login nodes \Rightarrow scaling becomes an issue
 - CCTBX: MySQL database for logging process state (completed, running, waiting)
 - Others: MongoDB (fireworks), or sometimes just writing to file
- Collaborative workspaces to facilitate dataset access and analysis
 - NERSC features collaborative accounts (users from a particular group can login with the collaborative account credentials)
- Use a workflow manager! (or a **data center's API**)
 - Data centers can customize these to account for their system needs

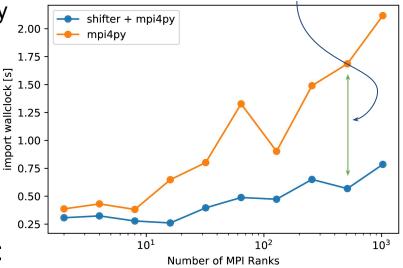

Packaging: Containers

- Design images to be portable:
 - Can Streamline cross-facility workflows by standardizing image build process
 - Optimize dependency handling, data analysis workflows tend to have complex dependencies
 - Shifter / Podman mounts
 NERSC-specific libraries into image
 - Isolate Anaconda's conflicts with OS
- Significantly lower import/loading times:
 - Image cached to node-local storage
 - Improved scalability even for few MPI Ranks

Dynamic linker's symbol resolution uses node-local storage \Rightarrow many ranks do not flood file-system.

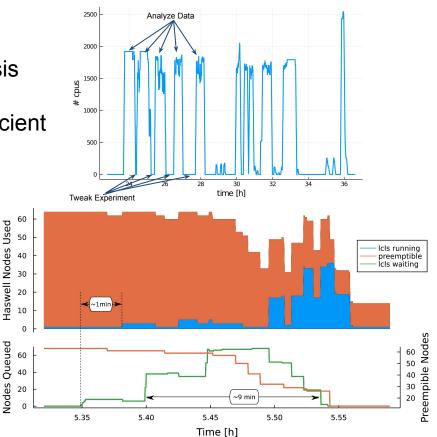

Priority: Job Queue and Urgent Computing

69

- Real-time data analysis workloads are bursty:
 - Experimental operators require analysis to make decisions about future runs
 - Regular queue turnaround time insufficient for real-time workflow
- Reserving nodes for bursty use is wasteful:
 - Nodes would sit idle
 - Solution: share reserved nodes with preemptible jobs
- Future: Explore flexible resource allocation (eg. malleable jobs)

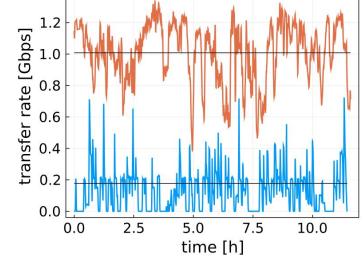

Packets: Network and I/O

- In data analysis workflows, file systems and network can become bottlenecks
- I/O Optimization is Crucial:
 - Optimize software (eg. python logger)for high-frequency parallel I/O
 - Write logs to Burst Buffer
- Experience during Beamtimes:
 - Transfers ran smoothly (most of the time), can switch redirect destination in emergencies
 - FS performance can limit the transfer rate
- Future Work:
 - Explore in-memory burst buffers, eg <u>https://github.com/LLNL/UnifyFS</u>
 - Offer more fine-grained control over which data is transferred and when
 - Better monitoring and alerting

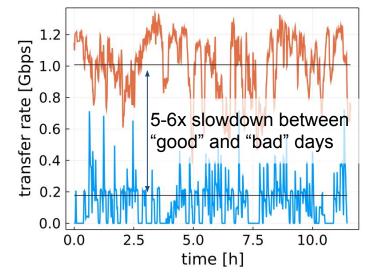

Packets: Network and I/O
