# **EnKF** Inversion

## Ensemble Kalman Filter (EnKF) and Inversion

#### **Problem Statement**

Find *u* from *y* where  $\mathcal{G} : X \mapsto Y$ ,  $\eta$  is noise and

 $y = \mathcal{G}(u) + \eta, \quad \eta \sim \mathsf{N}(0, \Gamma).$ 

- EnKF widely applied: geosciences, NWP and oceanography.
- Origins in sequential data assimilation. ([7] Evensen (1994)).
- Application to inverse problems. ([10] Iglesias (2016)).
- Requires only black box forward model G.
- Very limited theoretical understanding.

### Heuristic

Minimize, over a subspace defined via the linear span of an ensemble,

$$\Phi(\boldsymbol{u}) := \frac{1}{2} \|\boldsymbol{y} - \mathcal{G}(\boldsymbol{u})\|_{\Gamma}^{2}.$$

## Basic EnKF Inversion ([9] Iglesias et al (2013))

▶ Initial Ensemble  $\{u_0^{(j)}\}_{j=1}^J \subset X$ .

Ensemble First and Second Order Moments Means:

$$\overline{u}_n = \frac{1}{J} \sum_{\ell=1}^{J} \frac{u_n^{(\ell)}}{u_n^{(\ell)}}, \quad \overline{w}_n = \frac{1}{J} \sum_{\ell=1}^{J} \mathcal{G}(\frac{u_n^{(\ell)}}{u_n^{(\ell)}}).$$

Covariances:

$$C_n^{ww} = \frac{1}{J} \sum_{\ell=1}^{J} (\mathcal{G}(\boldsymbol{u}_n^{(\ell)}) - \overline{w}_n) \otimes (\mathcal{G}(\boldsymbol{u}_n^{(\ell)}) - \overline{w}_n),$$
$$C_n^{uw} = \frac{1}{J} \sum_{\ell=1}^{J} (\boldsymbol{u}_n^{(\ell)} - \overline{u}_n) \otimes (\mathcal{G}(\boldsymbol{u}_n^{(\ell)}) - \overline{w}_n).$$

• Update step  $n \mapsto n+1$ :

$$\boldsymbol{u}_{n+1}^{(j)} = \boldsymbol{u}_n^{(j)} + \boldsymbol{C}_n^{uw} \big( \boldsymbol{C}_n^{ww} + \boldsymbol{\Gamma} \big)^{-1} \big( \boldsymbol{y} - \boldsymbol{\mathcal{G}}(\boldsymbol{u}_n^{(j)}) \big).$$

Linear span of initial ensemble is preserved: [14] Li and Reynolds (2011), [9] Iglesias et al (2013). Implement iteratively regularized form: [10] Iglesias (2016).

## Continuous Time Limit

- Linear Case  $\mathcal{G}(\cdot) = A \cdot .$
- $\blacktriangleright \ \Gamma = h^{-1}\Gamma_0, h \to 0.$
- Least Squares Functional

$$\Phi(\boldsymbol{u}) = \frac{1}{2} \|\boldsymbol{y} - \boldsymbol{A}\boldsymbol{u}\|_{\Gamma_0}^2.$$

Gradient Structure

$$\frac{d u^{(j)}}{dt} = -C \nabla \Phi(u^{(j)}),$$

$$C = \frac{1}{J} \sum_{\ell=1}^{J} (u^{(\ell)} - \overline{u}) \otimes (u^{(\ell)} - \overline{u}).$$
(1)

### Theorem. ([13] Schillings and S (2016))

Algorithm minimizes  $\Phi(\cdot; y)$  over a finite dimensional subspace defined by the linear span of the initial ensemble.

# Numerical Results

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

## Groundwater Flow

#### Forward Problem

Given  $\kappa \in X := L^{\infty}(D; \mathbb{R}^+)$  find  $p \in H^1_0(D; \mathbb{R})$  such that:

$$-\nabla \cdot (\kappa \nabla p) = f, \quad x \in D,$$
  
 $p = 0, \quad x \in \partial D$ 

### **Inverse** Problem

Set  $\kappa = \exp(u)$ . Given K linear functionals of the pressure  $\mathcal{G}_k(u) = \ell_k(p)$ ,  $\ell_k \in H^{-1}(D; \mathbb{R})$ , find u from noisy measurements y where:

$$y = \mathcal{G}(u) + \eta, \quad \eta \sim \mathsf{N}(0, \Gamma).$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Numerical Experiments: Groundwater Flow

Unknown channel geometry ( $d \in \mathbb{R}^5$ ); unknown fields ( $v \in L^2(D; \mathbb{R}^2)$ ). Initial ensemble: draw i.i.d. d uniform and v Gaussian.

Figure: Left: true permeability. Right: reconstruction

## Electrical Impedance Tomography (EIT)

#### Forward Problem

Given  $(\kappa, I) \in L^{\infty}(D; \mathbb{R}^+) \times \mathbb{R}^m$  find  $(\nu, V) \in H^1(D) \times \mathbb{R}^m$ :

$$\begin{aligned} -\nabla \cdot (\kappa \nabla \nu) &= 0 \quad \in \quad D, \\ \nu + z_{\ell} \kappa \nabla \nu \cdot n &= V_{\ell} \quad \in \quad e_{\ell}, \quad \ell = 1, \dots, m, \\ \nabla \nu \cdot n &= 0 \quad \in \quad \partial D \setminus \cup_{\ell=1}^{m} e_{\ell}, \\ \int \kappa \nabla \nu \cdot n \, ds &= I_{\ell} \quad \in \quad e_{\ell}, \quad \ell = 1, \dots, m. \end{aligned}$$

Ohm's Law:  $V = R(\kappa) \times I$ .

#### Inverse Problem

Set  $\kappa = \exp(u)$ . Given a set of K noisy measurements of voltage  $V_k$  from currents  $I_k$ , and  $\mathcal{G}_k(u) = R(\kappa) \times I_j$ , find u from y where:

$$y = \mathcal{G}(u) + \eta, \quad \eta \sim \mathsf{N}(0, \Gamma).$$

## Numerical Experiments: EIT

Unknown inclusion geometry ( $d \in \mathbb{R}^3$ ); unknown conductivities ( $\kappa \in \mathbb{R}^2$ ). Initial ensemble: draw i.i.d. d uniform and  $\kappa$  uniform.

Figure: Left: Truth. Middle: J = 3. Right: J = 50.

Figure: Left: relative error. Right: data misfit.

where  $\xi \sim N(0, I)$  is white noise.

- See [4] Lindgren et al (2011).
  - Hierarchical: invert for parameters  $\theta$  as well as field v.
  - Centred approach: view  $(v, \theta)$  as unknowns.
  - Non-centred approach: view  $(\xi, \theta)$  as unknowns.

See [11] Papaspiliopoulos et al (2007).

## Groundwater Flow Revisited

Unknowns are:

- unknown channel geometry  $(d \in \mathbb{R}^5)$ ;
- unknown fields ( $v \in L^2(D; \mathbb{R}^2)$ );
- unknown hyperparameters ( $\theta \in \mathbb{R}^4$ ).

Initial ensemble and truth given by:

- initial ensemble: draw i.i.d. d uniform, v Gaussian and  $\theta$  uniform;
- true regularity parameters:  $(\alpha_1, \alpha_2) = (2.0, 2.8);$
- true inverse length scales  $(\tau_1, \tau_2) = (30.0, 10.0)$ .

## Numerical Experiments: Groundwater Flow

Figure:  $\alpha_1$  (truth 2) and  $\alpha_2$  (truth 2.8).

## The Inverse Problem

### Problem Statement

Find 
$$\mathbb{P}(u|y)$$
 from  $y$  where  $u \sim \mathbb{P}(u) = \mathsf{N}(0, C)$ ,  
 $\mathcal{G} : X \mapsto Y$  and  $y|u \sim \mathbb{P}(y|u) = \mathsf{N}(\mathcal{G}(u), \Gamma)$ .

- Considerably more computationally intensive than optimization.
- Allows soluton of inverse problems with uncertainty quantification.
- Monte Carlo Markov Chain is a key methodology.
- Mesh-independent convergence of MCMC is crucial.

Theorem. ([5] S (2010), [6] Iglesias et al (2016).)

Bayes' Rule for functions:

$$\mathbb{P}(du|y) = \frac{1}{Z} \exp\left(-\Phi(u)\right) \mathbb{P}(\mathsf{d} u).$$

 $\mathbb{P}(du|\cdot)$  Lipschitz in Hellinger metric.

## The Basic Function Space MCMC Algorithm

See [1] Cotter et al (2013).

- ▶ Initialize Pick  $u^{(0)} \in X$ .
- Propose  $u^{\star} = (1 \beta^2)^{\frac{1}{2}} u^{(n)} + \beta \xi^{(n)}, \quad \xi^{(n)} \sim N(0, C).$
- Accept Set  $u^{(n+1)} = u^*$  with probability

$$\min\left\{1,\exp\left(\Phi(\boldsymbol{u}^{(n)})-\Phi(\boldsymbol{u}^{\star})\right)\right\}.$$

• Otherwise set 
$$u^{(n+1)} = u^{(n)}$$
.

### Theorem. ([3] Hairer et al (2013).)

This algorithm converges with random constant K independent of mesh used to approximate forward model:

$$\mathbb{P}(g(u)|y) = \frac{1}{N}\sum_{n=1}^{N}g(u^{(n)}) + \frac{K(\xi)}{\sqrt{N}}$$

(Not true for RWM:  $u^* = u^{(n)} + \beta \xi^{(n)}$ ,  $\xi \sim N(0, C)$ .)

## Groundwater Flow Revisited

- Level set method: allows use of Gaussian priors to represent piecewise constant functions. See [6] Iglesias et al (2016), [2] Dunlop et al (2016).
- Threshold a continuous function at a number of levels.

• Let 
$$X = C^0(D)$$
, and define  $T : X \mapsto Z$  by

$$T(u)(x) = egin{cases} \kappa_1 & u(x) \in (-\infty, -1) \ \kappa_2 & u(x) \in [-1, 1) \ \kappa_3 & u(x) \in [1, \infty). \end{cases}$$

## Numerical Experiments: Groundwater Flow

- The forward map  $\mathcal{G}: X \mapsto \mathbb{R}^{K}$  is given by  $\mathcal{G} = \mathcal{F} \circ T$ ,  $\mathcal{F}: \kappa \mapsto p$ .
- We choose K = 36, and observe data

$$y = \mathcal{G}(u^{\dagger}) + \eta, \quad \eta \sim N(0, 0.05^2).$$

• True permeability  $T(u^{\dagger})$  and observed data y are shown below.

## Numerical Experiments: Groundwater Flow

## **Hierarchical Models**

- Use Whittle-Matern Gaussian random field.
- Recall  $\theta = (\alpha, \tau)$  denotes parameters encoding regularity and length-scale.
- Prior

$$\mathbb{P}(u,\theta) = \mathbb{P}(u|\theta)\mathbb{P}(\theta).$$

Posterior

$$\mathbb{P}(u,\theta|y) = \frac{1}{Z} \exp(-\Phi(u)) \mathbb{P}(u,\theta).$$

• Use of centred  $(u, \theta)$  or non-centred  $(\xi, \theta)$  variables possible:

$$(\tau^2 I - \Delta)^{\frac{\alpha}{2}} u = \sigma \tau^{\alpha - \frac{d}{2}} \xi,$$

• Use Metropolis-within-Gibbs to update  $\xi | \theta, y$  and  $\theta | \xi, y$ .

## Numerical Example: Groundwater Flow Revisited

- We return to the groundwater flow example. We use the same data y, but now use a hierarchical Gaussian prior in which the length scale and regularity of samples are treated as additional unknowns in the problem.
- True permeability  $T(u^{\dagger})$  and observed data y are shown below.

## Numerical Example: Groundwater Flow Revisited

- We return to the groundwater flow example. We use the same data y, but now use a hierarchical Gaussian prior in which the length scale and regularity of samples are treated as additional unknowns in the problem.
- ▶ Recall estimated mean  $T(\mathbb{E}(u))$  without hierarchical estimation.

## Conclusions

Hierarchical inversion: considerable benefits at little extra cost.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- Optimization: use EnKF.
- Sampling: use function space MCMC.
- Non-centred methods key to hierarchical success.
